Shim for nut	NAS463XC416NO	(649-785-125-0)

A. Introduction

Two attachment items for the access doors are required for use in this type or repair.

- (1) Floating type nut (NAS686, LHA3280B and A11471).
Replace them as described in Chapter B.
- (2) Anchor type nut (cage, nut and threaded bush assembly).
Replace them in the way described in Chapter C.

B. Replacing floating nuts

- (1) Remove damaged floating nuts, regrinding the heads of the rivets securing them. The procedure to be followed is described :
 - (a) For nuts LHA3280B and NAS686, in chapter RIVETING Section 70-50-10 : Standard assembly (see figure 401).
 - (b) For nuts A11471, in chapter RIVETING, Sections 70-50-10 : Standard assembly, and 70-50-50 : Assembly with CHERRY LOCK blind rivets (see figure 401, Sheets 4, 5, 10 and 11).
- (2) Fit a new floating nut in the following way :
 - (a) In case of nuts LHA3280B and NAS686, fit them as shown in figure 401 and secure them with rivets, following the instructions given in chapter "RIVETING", Section 70-50-10 : Standard assembly and the indications in figure 401.

MK.610-14-28

OVERHAUL

NOTE : In some types of LHA3280B floating nuts, remember to insert a shim between the nut and its support (see figure 401, Sheets 6 and 7).

(b) For floating nuts of the type A11471, proceed as follows :

- 1 Choose a nut suited to the thickness "E" of the unit fully assembled, in conformity with the values tabulated in figure 402.
- 2 Make sure before riveting that the out-of-flush level difference of the bush lies within the tolerance limits specified in figure 402. By this measure it is ensured that the nut is free to slide in its cage after riveting.
- 3 Secure the floating nuts as directed in chapter "RIVETING", Section 70-50-50 : Assembly with CHERRY LOCK blind rivets and in figure 401.

(3) Check the riveting of the floating nuts in compliance with the instructions given in chapter "RIVETING", Sections 70-50-81 : Standard assembly, and 70-50-85 : Assembly with CHERRY LOCK blind rivets.

C. Replacing Anchor Nuts

(1) Remove attachment items from access doors as follows :

- (a) Unscrew threaded bush 649-773-XXX-0, using tool SC 295.
- (b) Remove the nut cage assembly.
- (c) Remove self locking-nut 649-785-XXX-0.

(2) Recondition the attachment items of the access doors as follows :

NOTE : If the self-locking nut alone is damaged within the assembly, replace that item only.

- (a) Place the self-locking nut 649-785-XXX-0 into the nut cage so that the nut hex-head engages the hexagonal recess of the cage (see figures 401 and 403).

OLYMPUS 593

MK.610-14-28

OVERHAUL

- (b) Place the nut cage thus fitted out on the bracket so that the cage anti-rotation pin engages in its housing (see figures 401 and 403).
- (c) Choose a threaded bush 649-773-XXX-0 suited to thickness "E" of the unit fully assembled (see table in figure 403).
- (d) Pass the threaded bush through the hole provided for the purpose, and screw it into the nut cage assy as indicated in figure 403, using the standard toolkit.
- Tightening torque from 0,403 to 0,576 daN.m (35 to 50 in.lb).
 - Use securing tool SC 295 : figure 403.
- (e) Check the setup as shown in figure 403.

A. Renewing damaged captive nut.

- (1) Remove nut by grinding out retaining-rivet heads.

B. Fitting a new attachment item.

- (1) Fit a new nut and riveting washer, and secure them by riveting as directed in chapter "RIVETING", section 70-50-10, in figure 401, and in following instructions.
- (a) Choose a captive nut suited to thickness "E" of unit fully assembled as directed in figure 401.

OVERHAUL

- (b) Ascertain before riveting nuts type A11471 that the out-of-flush level difference of the bush lies within the tolerances specified in figure 401 (Sheet 5). If it does, the free sliding of the nut in its cage is ensured after installing the heat shield.

- (2) Machine the rivet heads flush with the riveting washer

C. Checking

- (1) Check the application of rivets as per instructions in chapter "RIVETING", section 70-50-80.

REPAIR

TWIN SECONDARY NOZZLE (29-190/191)

5. Reconditioning the Airfoil by Use of an Elastomer.

PARTS REQUIRED FOR REPAIR

Primary MB (P 475)
Silicone elastomer CAF 4 (P 474)

A. Introduction

This type of repair is applied to the inner and outer nozzle skin in the event of damage e. g. by impact or scoring exceeding in depth the limit value laid down by Quality Control.

B. Procedure

(1) Tracing the Defect

- (a) Prior to repairing, make sure that the dented area is free from :
 - cracks (use a twin-lens magnifier of x 20 power)
 - separation of layers (sound test by means of a metal part).

The occurrence of either of these defects rules out the use of this type of repair.

(2) Reconditioning the Airfoil

- (a) Recondition the airfoil by the use of silicone elastomer CAF 4 using method M 701 as described in chapter "APPLICATION OF RESINS AND ELASTOMERS" section 70-31, and following the instructions below :
 - the area to be repaired is degreased with a cloth steeped in trichlorethylene (P 76 A).

OLYMPUS 593

MK.610-14-28
OVERHAUL

- the area under repair is prepared by polishing with emery paper.
- (b) With the elastomer properly cured, polish off surface roughness, if necessary, by the use of emery paper.

REPAIR

TWIN SECONDARY NOZZLE (29-190/191)

6. Replacement of BAC Seal Fasteners

PARTS REQUIRED FOR REPAIR

Blind bolt VISU LOK PLT 1004-6-4 (650-089-931-0)
Blind bolt VISU LOK PLT 1004-6-5 (650-089-932-0)
Blind bolt VISU LOK PLT 1004-6-6 (650-089-933-0)
Support plate assemblies 002-003-604 to 610-0
Support plate assemblies 002-003-809 to 817-0

Reinforcement plate, complete 002-004-003-0

Cover 002-004-004-0

Screw (649-781-525-0)

NOTE : This repair scheme applies to twin secondary nozzles with no access doors to the BAC-seal fasteners. To nozzles having such doors, points C,D and E are alone applicable.

A. Making access openings

- (1) Mark out the bolt holes, reinforcement plate attachment points and access openings as illustrated in Fig. 401.
- (2) The openings in the stressskin panels are made by means of tangent holes as instructed in chapter section 70-30-10 "PRINCIPLES OF REPAIR" and illustrated in Fig. 401.
- (3) Deburr carefully, using a dental burr.
- (4) Close up any cavities round the borders of the openings, using Araldite resin AV 138 with asbestos fibres for filler, as described under method M 700 in chapter section 70-31-00 "APPLICATION OF RESINS AND ELASTOMERS".

78-13-01

REP 29-190-6

Page 401

Jan 31/81

NOTE : Where necessary, smooth down the edges of the openings with abrasive tape to the dimensions specified in Fig. 401, sheet 3.

- (5) Mount the fully equipped reinforcement plates as follows :
- (a) Drill bolt holes as marked out and shown in Fig. 401.
Deburr carefully.
 - (b) Put the reinforcement plates in position and pin them on through the bolt holes, careful not to damage the nuts.
 - (c) Drill the retaining holes as marked out, described in chapter "RIVETING" section 70-50-60, and shown in Fig. 401.
 - (d) Deburr the holes as instructed under heading D "Deburring" in chapter "RIVETING", section 70-50-60.
 - (e) Dimple the panel as described in chapter "RIVETING", section 70-50-60.
 - (f) Fit the blind bolts serving to secure the complete reinforcement plates, as shown in Fig. 401, sheet 3, and directed in chapter "RIVETING", section 70-50-60.

B. Removing floating anchor nuts

NOTE : Under this repair scheme, the nut adjacent to the defective nut is to be removed if both are on the same support plate.

- (1) Grind out the nut retaining rivet heads with a cutting wheel.
- (2) Remove the floating anchor nuts and use a grinding wheel to flush off the rest of the rivet metal near the angle section (See Fig. 401, sheet 5).

C. Removing blind bolts

- (1) Remove the blind bolts securing the top panel to the angle section at the locations marked out for the support plate assemblies as instructed in chapter "RIVETING", section 70-50-60.

D. Mounting the fully equipped support plates

- (1) Put the support plates in position on the angle section, and pin them on through the bolt holes, careful not to damage the nut threads.
- (2) Drill mark the retaining holes, and take off the support plates.
- (3) Drill out the blind bolt holes, as described in chapter "RIVETING", section 70-50-60. Carefully deburr the holes.
- (4) Position and mount the support plate fasteners on the angle section, as instructed in chapter "RIVETING", section 70-50-60. Assemble with blind bolts, as shown in Fig. 401.
- (5) Inspect the riveting as described in chapter "RIVETING" section 70-50-86.

E. Mounting the access doors

- (1) Put the cover in position as shown in Fig. 401, Sheet 4
- (2) Fit 649-781-525-0 bolts and locks them fast to a torque of 0,80 to 0,90 daNm (70 to 80 lb. in).

A. Introduction

Under this repair scheme, the repair of suspension links may be one of two types :

- Type 1 : Using existing items and a "repair" assembly bolt
Type 2 : Using new items and an "original" assembly bolt

B. Disassembly

- (1) Take down the links-and-yokes assembly, removing the blind rivets from the bay/yoke outer panels, as instructed in chapter "Riveting", section 70-50-50 : "Joints made by the Use of Cherry-Lock Blind Rivets", and the barrel/yoke retaining Hi-Lok Bolts as instructed in chapter "Riveting", section 70-50-40 : "Joints Made by the Use of Hi-Lok Fasteners".
- (2) Uncouple the links from the yokes as follows :
 - a) Remove the split pin.

78-13-01

REP 29-190-8

Page 402

Apr 30/93

OLYMPUS 593

MK.610-14-28

OVERHAUL

- (b) Remove the castellated nut with a standard tool.
- (c) Drive out the assembly bolt, careful not to damage the bolt hole.
- (3) Separate the links from the spacer removing the retaining rivets as instructed in chapter "Riveting", section 70-50-50 : "Joints Made by the Use of Cherry-Lock Blind Rivets".

C. Inspection

NOTE : This procedure is intended to determine which of the two forms of repair is to be applied to the links.

- (1) Measure the dimension and the ovality of the assembly bolt holes in the parts concerned.
 - (a) If the measured value is $6,73 \begin{smallmatrix} + 0,1 \\ + 0 \end{smallmatrix}$ mm
 $(0,265 \begin{smallmatrix} + 0.004 \\ + 0 \end{smallmatrix}$ in.) dia., repair the links as instructed under D. in this repair scheme.
 - (b) If the measured value exceeds diameter (a) above, repair the links as instructed under E. in this repair scheme.

D. Repair of suspension links, Type 1

NOTE : In this link repair scheme, the existing yoke and link assemblies are to be used.

- (1) Fit new washers as follows :
 - (a) Using a centring pin, fit new washers on either supporting yoke side, as shown in Fig. 401, sheets 14 and 15.

78-13-01

REP 29-190-8

Page 403

Mar 31/78

OLYMPUS 593

MK.610-14-28
OVERHAUL

- (b) By argon arc welding, make 4 weld spots on each washer, as instructed in chapter "Welding", section 70-35-10 "Fusion Welding", and shown in Fig. 401, sheet 15.
- Weld filler wire : P 3008 (Z8CND15)
 - Weld class : B1
- (2) Perform a class B1 weld inspection as instructed in chapter "Welding", section 70-35-10 : "Fusion welding".
- Carry out a localized water-washable fluorescent penetrant test by method M 503 B as described in chapter section 70-20-10 : "Dye Penetrant Inspection".
- (3) Heat-treat the supporting yokes by method M 822 followed by method M 821 described in chapter section 70-45-10 : "Heat Treatments".
- (4) Make assembly-bolt holes in the following manner :
- (a) Locate the outer bay-side links and yoke and attach them through the existing rivet holes.
 - (b) Counter drill the bolt holes to $6,73 + 0,1$ mm
($0,265 + 0.004$ in.) dia.
- (5) Assemble links and yokes on outer sides of bays as follows :
- (a) Sandwich a thin washer between the assembly bolt head and the link (See Fig. 401, Sheet 14).
 - (b) Mount the assembly bolt into hole as shown in Fig. 401.
 - (c) Fit a castellated nut, with a thin washer sandwiched between it and the link.
- Tighten the nut with a standard tool, taking care to register the pin hole with an undercut in the castellated nut.

- Torque to 0,023 to 0,046 daN.m (2-4 lb. in.)
- (d) Mount the split pin into the corresponding recess as directed in chapter "Assembly", section 70-70-50 : "Locking".
- (6) Assemble the links with the spacer as follows :
 - (a) Put the corresponding parts in position (See Fig. 401)
 - (b) Counter drill the spacer retaining holes through the existing holes, and make the links -and- spacer joint with the new rivets, as instructed in chapter "Riveting", section 70-50-10 : "Joints Made by the Use of Solid Rivets", as shown in Fig. 401.
 - (c) Check the riveting as directed in chapter "Riveting", section 70-50-81 : "Inspection of Standard Rivets".
- (7) Drill the assembly-bolt hole as follows :
 - (a) Locate and pin the yoke on the inner bay side and the assembly on the outer side through the existing retaining holes.

NOTE : Remember to place shims underneath the inner/yoke (See Fig. 401).

 - (b) Mark out the assembly bolt hole on the yoke with a centre punch.
 - (c) Unpin and remove the yoke and assembly.
 - (d) Make pilot holes of $6,5 \pm 0,1$ mm (0.256 ± 0.04 in.) dia. in the links and the yoke ; deburr.
- (8) Mount yokes and links as follows :
 - (a) Locate and pin the outer supporting yoke on the nacelle.

OVERHAUL

- (b) Rebore the yoke/angle-section retaining holes as shown in Fig. 401 as instructed in chapter "Riveting", section 70-50-60 : "Joints Made by the Use of Blind Bolts".
- (c) Put the yokes in position on the nacelle as shown in Fig. 401, and mount the fasteners as instructed in chapter "Riveting", section 70-50-40 : "Joints Made by the Use of Hi-Lok Fasteners", 70-50-50 : "Joints Made by the Use of Cherry-Lock Blind Rivets", and 70-50-60 : "Joints Made by the Use of Blind Bolts".
- (d) Place the links into their relative positions to the inner yoke, and rebore the assembly bolt hole to the diameter specified in the table in Fig. 401, sheet 15.
- (e) Assemble the links with the inner supporting yoke as directed under (5) in this repair scheme (D).

E. Repair of suspension links, Type 2

NOTE : In this repair scheme, new supporting yokes and link assemblies are to be used.

- (1) Fit out the new yokes with washers as described under (1), (2) and (3) in the Type 1 link repair scheme (D).
- (2) Drill out the assembly bolt hole in the outer yoke as follows :
 - (a) Put the yoke in its relative position to one of the links.
 - (b) Mark out the assembly bolt hole with a centre punch.
 - (c) Drill the yoke to the diameter specified in the table in Fig. 401, sheet 15.
- (3) Assemble the links with the outer yoke as instructed under (5) in the Type 1 link repair scheme (D).
- (4) Assemble the links with the spacer as follows :

PRINTED IN FRANCE

78-13-01

REP 29-190-8

Page 406

Mar 31/78

- (a) Put the spacer in its relative position to the links (See Fig. 401).
 - (b) Counter drill the spacers, and make the joint between links and spacers with new rivets, as instructed in chapter "Riveting", section 70-50-10 : "Joints Made by the Use of Solid Rivets", and as shown in Fig. 401.
 - (c) Check the riveting as instructed in chapter "Riveting", section 70-50-81 : "Inspection of Standard Rivets".
- (5) Drill the yoke retaining holes on the nacelle as follows :
- (a) Put the links-and- outer yoke assy in position on the nacelle.
 - (b) Counter drill the yoke retaining holes as instructed in chapter "Riveting", sections 70-50-50 : "Joints Made by the Use of Blind Rivets", and 70-50-60 : "Joints Made by the Use of Blind Bolts", and as shown in Fig. 401. Pin the assembly on to the nacelle.
 - (c) Put the inner supporting yoke in its relative position to the assembly.
 - (d) Counter drill the Hi-Lok bolt holes as instructed in chapter "Riveting", section 70-50-40 : "Joints Made by the Use of Hi-Lok Fasteners", and shown in Fig. 401.
- (6) Drill out the links-and-inner yoke fixing bolt hole as follows :
- (a) Sandwich a shim between the inner supporting yoke and the barrel, and pin on.
 - (b) Put the links in position on the inner supporting yoke.
 - (c) Mark out the bolt hole on the yoke (See Fig.401, sheet 15).
 - (d) Unpin the inner yoke and the links/outer yoke assy, and remove.

REPAIR

TWIN SECONDARY NOZZLE (29-190/191)

9. Replacement of Defective Fasteners on Inner and Outer
Skin Panels.

PARTS REQUIRED FOR REPAIR

The types and diameters of fasteners used are specified in Fig. 401.

Their lengths are not given, as they cannot be determined before the thickness of the particular assemblies have been ascertained.

- A. Replacement of blind bolts PLT 120, PLT 220 and PLT 1004 (see table, figure 401).
- (1) Replace as described in Standard Practices, chapter 70-50-60.
 - (2) Check the way the bolts have been mounted, as instructed in Standard Practices, chapter 70-50-86.
- B. Replacing HI-LOK bolts HL 869 (See Table in Fig. 401)
- (1) Where the bolts can be got at from both sides :
 - (a) Replace as directed in Standard Practices, chapter 70-50-40.
 - (b) Check the way the bolts have been mounted, as instructed in Standard Practices, chapter 70-50-84.
 - (2) Where the bolts are accessible from one side only :
 - (a) Remove such bolts as described in Standard Practices, chapter 70-50-40.
 - (b) Fit a PLT blind bolt (Standard Practices, 70-50-60).
 - (c) Check the way the bolt has been mounted (Standard Practices, 70-50-86).

- C. Replacing HI-LOK bolts HL 667 - HL 169 - HL 167 (see Fig. 401).
- (1) Replace as described in Standard Practices, chapter 70-50-40.
 - (2) Check the way the bolts have been mounted, as instructed in Standard Practices, 70-50-84.
- D. Replacing Lockbolt fasteners (see Fig. 401)
- (1) Replace as described in Standard Practices, 70-50-30.
 - (2) Check the way the fasteners have been mounted, as instructed in Standard Practices, chapter 70-50-83.
- E. Replacing Cherrylock rivets (see Fig. 401).
- (1) Replace as described in Standard Practices, chapter 70-50-50.
 - (2) Check for proper riveting as instructed in Standard Practices, chapter 70-50-85.
- F. Replacing threaded bushes and inserts

The replacement of these items, which serve to secure inspection doors, is covered by REP 29-190-3.

REPAIR

TWIN SECONDARY NOZZLE (29-190)

10. Replacement of Bushings at the Bucket Pneumatic Drive Actuator

Mounting Points

PARTS REQUIRED FOR REPAIR

Round bar	P3601 (26NCT25SV)
Bolt	NAS 6704DU14 (649-774-214-0)
Bolt	NAS 6704DU16 (649-774-215-0)

A. Introduction

- (1) This repair scheme only applies when the recess which accommodate the bushings on the mounting yokes are damaged.

B. Machining

- (1) Re-bore the yoke bushing recesses to remove all deteriorations. Deburr.

NOTE : For both yokes (sections C and D) re-bore the recesses as indicated in figure 401.

C. Machining the Bushings.

- (1) Out of round bar P3601, machine the bushings as indicated in figures 402, 403, 404 and 407.
- (2) For pin assemblies (See sections C, D, E and view F), shrink the screw in liquid nitrogen prior to fitting.
- (3) Measure and record the exact bushing recess diameter of the re-bored yokes.
- (4) Select the bushings as indicated in figure 401.
- (5) Rework the bushing dia. "D" to obtain an assembly fit of 0 to 0,02 mm (0 to 0.0008 in.) with the re-bored yoke dia.

D. Installing the bushing.

REPAIR

TWIN SECONDARY NOZZLE (29-190/191)

11. Repair of cracks on inner and outer skin panels

PARTS REQUIRED FOR REPAIR

Weld filler wire P 3008 or P 3030

Silicone elastomer CAF (P 474)

A. Repair of cracks max. 25 mm (1 in.) in length, redeveloping in mid-sheet.

(1) Restrictions on repairs

The sound area surrounding the side of repair must be 100 mm (3.9 in.)

The crack must not lie in a delaminated area.

(2) Repair instructions

(a) Monitor the condition of the crack surround, ascertaining by a sound test made with a metal object, that there is no delamination. If there is, this repair scheme is unsuitable for use.

(b) Accurately demarcate the crack on careful scrutinizing with a X 20 twin-lens magnifier, then drill a 1 mm (0.039 in.) dia. hole at its either end.

CAUTION : DRILL THE UPPER FACE SHEET OF THE PANEL ONLY.

(c) Weld-fill the crack by the argon arc process adhering to the instructions in Chapter "PRINCIPLE OF REPAIRING COMPONENTS MADE FROM WELDED HONEYCOMB STRUCTURE" Section 70-30-10, and in Chapter "WELDING", Section 70-35-10.

Filler metal : P 3008 or P 3030

Weld Class B1

NOTE : It is essential in welding to apply copper cooling (heat sink) blocks as close to the weld as possible.

78-13-01

REP 29-190-11

Page 401

OLYMPUS 593

MK.610-14-28
OVERHAUL

- (d) Check the Class B1 weld as instructed in Chapter "WELDING", Section 70-35-80, and in the following :

Perform a water-washable dye penetrant test by Method M501B as described in Chapter 70-20-10.

CAUTION : THE PENETRANT IS TO BE CLEARED OUT
USING A CLOTH SOAKED WITH ISOPROPYL
ALCOHOL (P442).

- (e) Ascertain that the segment under repair is free from delamination by a sound test made with a metal object.

B. Repair of cracks developing in the original weld beads.

(1) Restrictions on repairs

The crack must not lie in a delaminated area.
No limitation is set on length.

(2) Repair instructions

The same repair instructions as those under A. apply to cracks of this type.

C. Repair of cracks proceeding from a rivet hole (see figure 402).

(1) Restrictions on repairs

The sound area around the site of repair must be 100 mm (3.9 in.).
The crack must not lie in a delaminated area.
The length of the crack must not exceed 25 mm (1 in.).

(2) Repair instructions

- (a) Prior to repair, ascertain, by a sound test made with a metal object, that the area surrounding the crack is free from delamination.
- (b) Remove the rivet as instructed in Chapter "RIVETING", 70-50-60.
- (c) The instructions for weld-filling the crack are the same as those under A.

78-13-01

REP 29-190-11

Page 402

OVERHAUL

- (d) For outer panels only :

Seal the hole edges with elastomer CAF4 by Method M701 described in Chapter "APPLICATION OF RESINS AND ELASTOMERS", Section 70-31-20.

NOTE : When polymerizing the elastomer insert a tetrafluorethylene-coated rivet so as to hold it in place.

- (e) Apply the rivet as instructed in Chapter "RIVETING", Section 70-50-XX.
- (f) Check the rivet as directed in Chapter "RIVETING", Section 70-50-8X.

REPAIRTWIN SECONDARY NOZZLE (29-190)12. Repair of Delaminations Affecting the Inner and Outer Skin Panels.

PARTS REQUIRED FOR REPAIR

Sheet metal NC 22 DNb (P 3322) ; thickness : 1,2 mm
(0.047 in.)

Epoxy resin Araldite AV 138 (P 472)
 Hardener HV 998 (P 473)
 Asbestos fibre (P 476)

Spacer 002-003-992-1 to 3

Washer AN 960-C8 (649-786-152-0)
Screw HL 144-5-12 (649-781-706-0)
Nut HLN 1G-5 (649-785-047-0)

Rivet CR 2840-5-6 (649-772-099-0)
Rivet CR 2839-6-6 (649-772-092-0)
or Rivet CR 2839-6-7 (649-772-169-0)

A. Introduction

Two cases are considered in this repair scheme :

- Repair of a delamination when the panel is accessible from both sides.
- Repair of a delamination when the panel is accessible from one side only.

B. Repair of delaminations when panel is accessible from both sides.**(1) Restrictions on repair**

- the delamination must not be associated with a crack,

78-13-01

REP 29-190-12

Page 401

Sep 30/78

OLYMPUS 593

MK.610-14-28

OVERHAUL

- the sound area all around the repair must span 150 mm (5.9 in.),
- maximum number of such repairs per mesh : 1.

(2) Repair instructions

- (a) Prior to carry out the repair, check the condition of the zone to be repaired.

- Check for cracks using a X 20 power binocular eye-piece.

Do not apply this kind of repair if cracks are present.

- (b) Using very fine grade abrasive paper, lightly sand the panel until the cell pattern shows up in the area under repair.

- (c) Center punch and drill attachment holes to $4,17 + 0,1$ mm (0.164 in.) dia. Deburr holes.
0 (0.168 in.)

NOTE : The pitch between fixings is 25 mm approx. (1.0 in.) ; each hole to be centered in one cell.

- (d) On the panel, counterbore the passage holes provided for the spacers in accordance with figure 401.

NOTE : Do not rebores through the panel outer skin (face sheet).

- (e) Install the spacers into the holes using Loctite 307 (P 502) bonding agent to hold them in place upon the installation of the HI-LOCK screws (See Table in figure 401).

- (f) Install the fixings as indicated in figure 401 and instructed in chapter 70-50-40 of the Standard Practices manual.

- (g) Inspects the fixings in accordance with chapter 70-50-84.

OLYMPUS 593

MK.610-14-28

OVERHAUL

C. Repair of delaminations when panel is accessible from one side only.

(1) Restrictions on repairs

- (a) Repair applicable only in the non-restricted zones.
- (b) The sound area all around the repair to span 200 mm (7.9 in.).
- (c) Maximum number of such repairs per mesh : 1.

(2) Repair instructions

- (a) Delineate the damaged zone to be removed taking account of the dimensions of doubler (reinforcing plate) to be blind fitted (See figure 402).
- (b) Cut out and remove the damaged zone using a drilling template featuring tangent holes as indicated in chapter 70-30-10 of the Standard Practices manual.
- (c) Seal the exposed edges of panel using Araldite AV 138 as instructed by method M 700 of chapter 70-31-20, "EMPLOYMENT OF RESINS AND ELASTOMERS".
- (d) Sand lightly the panel with a very fine abrasive paper until the cell pattern shows up.
- (e) Position a sheet of tracing paper on the panel ; transfer the cell pattern on the tracing paper and mark the location of rivets and the external contour of doublers.
- (f) Cut out the doublers (reinforcing plates) and shape them to match the contour of the zone under repair ; machine the edges of doublers as indicated in figure 402. Sheet metal material NC 22 DNB (P 3322), 1,2 mm (0.047 in.) thick.
- (g) Stick the tracing paper on the external doubler, on the side of the latter to be in contact with the panel. Center punch the location of CHERRY LOCK fixings CR 2839-6.
- (h) Drill through the external doublers the holes drill-marked above to 3 mm (0.118 in.) dia. and deburr holes.

78-13-01

REP 29-190-12

Page 403

Sep 30/78

OLYMPUS 593

MK.610-14-28

OVERHAUL

- (i) In a single operation, drill through the doublers the rivet holes for the CHERRY-LOCK rivets CR 2839-6 as instructed in chapter "RIVETING", section 70-50-50.

NOTE : Bring into contact those two faces of the doublers which are to bear on the panel.

- (j) Stick the tracing paper on the side of the internal doubler to be in contact with the panel. Center punch the locations of CHERRY LOCK fixings CR 2840-5-6.
- (k) Carry out the drilling of the internal doubler to a diameter of 3 mm (0.118 in.) (Pre-drilling for the CHERRY LOCK CR 2840-5-6 holes).
- (l) Position the external doubler on the twin secondary nozzle panel and counterdrill the rivet holes for rivets CR 2839-6, see chapter "RIVETING", section 70-50-50.
- (m) Position the internal doubler on the twin secondary nozzle panel and hold it in place using pins inserted through CR 2839-6 rivet holes.
- (n) Counterdrill, through both the doubler and the panel, the CR 2840-5-6 rivets holes as indicated in chapter "RIVETING", section 70-50-50.
- (o) Carefully deburr the edges of holes drilled in the panel and the doubler then, produce the countersinks for the CHERRY LOCK fixings CR 2840-5-6. Refer to chapter "RIVETING", section 70-50-50.
- (p) Rivet the doublers onto the panel as instructed in chapter "RIVETING", section 70-50-50 and per the following instructions :
- Position the internal doubler on the panel and rivet it using rivets CR 2840-5-6.
 - Pin the external doubler onto the panel and joint the whole assembly using rivets CR 2839-6-6 or 6-7.
- (q) Inspect the riveting as instructed in chapter "RIVETING", section 70-50-85.

A. Restrictions on repairs

Cracks or delaminations lying in this zone are acceptable once repaired in accordance with REP 29-190-11 or REP 29-190-12.

B. Repair instructions

- (1) Lightly sand the panel using very fine grain abrasive paper so that the cell pattern shows up in the area under repair.
- (2) On a sheet of tracing paper, transfer the cell pattern and mark the locations of rivets and outer contour of doublers (reinforcing plates).
- (3) Shape the doublers to match the contour of the panel and cut out the doublers.
- (4) Stick the tracing paper on the face of the external doubler to come in contact with the panel.
Center punch the rivet locations.
- (5) In a single operation, drill the rivet holes through the doublers, as indicated in chapter "RIVETING", section 70-50-50.
- (6) Drill the rivet holes through the stressskin panel as indicated in chapter "RIVETING", section 70-50-50 and as instructed hereafter :

- Position the external doubler on the panel.
 - Counterdrill two 3 mm (0.118 in.) dia. holes.
 - By means of these two holes, pin the doubler on the panel.
 - Counterdrill the other holes in the panel to 3 mm (0.118 in.) dia.
 - Using the internal doubler, check for the correct hole locations.
 - Counterbore all the holes in the panel to the final diameter and deburr holes carefully.
- (7) Carry out the countersinks on the external doubler.
- (8) Rivet the internal and external doublers to the panel as instructed in chapter "RIVETING", section 70-50-50.
- (9) Inspect the riveting as per chapter "RIVETING", section 70-50-85.

A. Dismantling the drain-tube

- (1) Remove the angle-piece fasteners as shown in figure 401, Sheet 1 of 4, and instructed in Standard Practices, Chapters :
70-50-10 for rivets marked "A" and "D"
70-50-50 for rivets marked "B" and "C"
- (2) Take the angle-piece off
- (3) Dismount the drain-tube by removing its fasteners as instructed in Standard Practices, Chapters :
70-50-50 for CHERRY-LOCK rivets
70-50-40 for HI-LOCK bolt
in order to detach the support (see figure 401, Section A-A).

B. Repairing the drain-tube elbow

- (1) Cut off the drain-tube elbow, put the new elbow in place and arc-weld with weld filler wire P3009 as shown in figure 401, Sheet 3 of 4, and instructed in Standard Practices, Chapter 70-35-10.

C. Repairing the drain-tube end fitting

- (1) If the tube end fitting is damaged, cut it off and arc-weld on a new end-piece with weld filler wire P3009 as shown in figure 401, sheet 3 of 4, and instructed in Standard Practices, Chapter 70-35-10, and in the following :
 - (a) Locate and weld the gutter on the end-piece.
 - (b) Locate and weld the end-piece on the drain-tube.

D. Inspection of welds

- (1) Carry out a soundness inspection of the Class B2 welds as instructed in Standard Practices, Chapter 70-35-80, and in the following :
Perform a water-washable dye penetrant test by Method M 501B as described in Chapter 70-20-10.

E. Replacement of the support clamps

- (1) Replace any defective tube support clamp(s) in the way directed in Standard Practices, Chapter 70-50-50, in figure 401, Section B-B, and in the following :
 - (a) Grind out the two CHERRY-LOCK rivets and remove the clamps.
 - (b) Apply a new clamp and secure it on by riveting.
- (2) Check the riveting as instructed in Standard Practices Chapter 70-50-85.

OVERHAUL

F. Reinstalling the tube

- (1) Take the flange off the cut-off elbow.
- (2) Place it against that of the drain-tube in such a way as to bring the hole marked ① on sheet 2 of 4 into line with the tube centreline.
- (3) Mark the location of hole ① on the new flange.
- (4) Drill the hole to a dia. of $4,47 \begin{smallmatrix} + 0,1 \\ + 0 \end{smallmatrix} \text{ mm}$ $\begin{smallmatrix} 0.176 \\ 0.180 \end{smallmatrix} \text{ in.}$ and deburr.
- (5) Put the drain-tube in position on the structure with the aid of hole ① and the tube support.
- (6) In this position drill-mark the other two hole locations on the drain-tube flange (See figure 401, sheet 2 of 4).
- (7) Remove the tube, drill out the two drill marked holes and deburr.
- (8) Position and secure the drain-tube as instructed in Standard Practices :
 - (a) Chapter 70-50-50 for CHERRY-LOCK rivets
 - (b) Chapter 70-50-40 for the HI-LOCK support fastening bolts (see figure 401, sheet 2 of 4).
- (9) Check the riveting as instructed in Standard Practices :
 - (a) Chapter 70-50-85 for CHERRY-LOCK rivets
 - (b) Chapter 70-50-84 for HI-LOCK bolts.
- (10) Put the angle-piece in position. Rebore the holes market A and D to a dia. of $3,63 \begin{smallmatrix} + 0,08 \\ + 0 \end{smallmatrix} \text{ mm}$ $\begin{smallmatrix} 0.143 \\ 0.146 \end{smallmatrix} \text{ in.}$ See figure 401, sheets 1 and 2.
- (11) Machine the countersinks of these holes to a dia. of $5,72 \pm 0,1 \text{ mm}$ $\begin{smallmatrix} 0.221 \\ 0.229 \end{smallmatrix} \text{ in.}$

REPAIRTWIN SECONDARY NOZZLE (29-190)16. Applying doublers to tops elevon panels

PARTS REQUIRED FOR REPAIR

Doubler plates	: Sheeting P3344 (T60)	
	Thickness : 1 mm (0.039 in.)	
Reinforcement plates	: Sheeting P3344 (T60)	
	Thickness : 1,2 mm (0.047 in.)	
Angle section assy	: 002-004-008-0	
Cover assy	: 002-004-009-0	
Screw, head 100° countersink	: NAS 1102-E3-16	
	(649-781-140-0)	
Blind rivet	: CR 2839-5-3	(649-772-084-0)
Blind rivet	: CR 2839-5-4	(649-772-085-0)
Blind rivet	: CR 2839-5-6	(649-772-086-0)
Blind rivet	: CR 2839-5-8	(649-772-087-0)
Blind rivet	: CR 2839-6-6	(649-772-092-0)
Spacer washer	: 002-004-010-0	
Spacer washer	: 002-004-048-0	

Under this repair scheme, doublers of areas suited to the extent of damage are applied to the upper elevon panels, notably :

- 1 or 2 doublers per elevon ; or
- 1 doubler plate covering the surface area of 3 doublers (see Fig. 402, sheets 1 and 2).

A. Making up doublers

- (1) Cut doubler plates out of P3344 sheeting (T60) of 1 mm (0.039 in.) thickness, in sizes specified in Fig. 402.

NOTE : If required, cut doublers out of doubler plates as indicated in Fig. 402.

- (2) Shape the doublers to the elevon contours and the positions shown in Fig. 401.

78-13-01

REP 29-190-16

Page 401

Jan 31/81

OLYMPUS 593
MK.610-14-28
OVERHAUL

- (3) Round off angles coming into contact with the elevon Stressskin panels as shown in Fig. 402.

B. Making up reinforcement plates

- (1) Cut reinforcement plates out of P3344 sheeting (T60) of 1,2 mm (0.047 in.) thickness, as shown in Fig. 403 and, where applicable, in Fig. 401.
- (2) Round off sharp edges coming into contact with the Stressskin panel as shown in Fig. 403, sheet 1.

C. Making access openings

- (1) Make openings in the panel as directed in Chapter "Principle of Repair", Section 70-30-10, 4 : "Machining", and as shown in Fig. 401.
- (2) Close up cavities round the borders of the openings, using Araldite resin P472 (AV38), with asbestos fibres P476 added as a filler, in the way described under Method 700 in Chapter Section 70-31-00 "Application of Resins and Elastomers".

D. Removal of fasteners

- (1) Remove existing blind rivets from the locations set out for the doubler fasteners in the way instructed in Chapter "Riveting", Sections 70-50-50 : "Joints Made by the Use of Cherry-Lok Blind Rivets", and 70-50-60 : "Joints Made by the Use of Blind Bolts".

E. Drilling the doublers

- (1) Trace out the existing holes on the doubler(s) as follows :
 - (a) Stick strips of Stabilene tracing-paper on the upper elevon panel.
 - (b) Mark the locations of the retaining holes.
 - (c) Put the doubler(s) in position on the elevon, as shown in Fig 401.

78-13-01

REP 29-190-16

Page 402

Jan 31/81

(d) Stick the Stabilene strips on the doublers, and take them down.

- (2) Make rivet holes of the following diameters in the doublers :
- | | | | | |
|-----------|----|---------|------|-------------------------|
| 5 + 0,1 | mm | (0.197 | in.) | for fasteners marked A, |
| 5 + 0 | | (0.201 | | B, C and D ; |
| 5,7 + 0,1 | mm | (0.224 | in.) | for fasteners marked E. |
| + 0 | | (0.228 | | |
- (3) Rebore the retaining holes in the elevon panel as instructed in Chapter "Riveting", Section 70-50-50 : "Joints Made by the Use of Cherry-Lock Blind Rivets", and as shown in Fig. 401.
- (4) Place the doublers on the elevons as follows :
- (a) Fit the spacer washers coated with Loctite 307 (P502) into the existing recesses.
- (b) Locate and pin the doubler(s) on the elevons as illustrated in Fig. 401.

F. Drilling the reinforcement plates

- (1) Put the reinforcement plates in position on the outer surface of the doublers as shown in Fig. 401.
- (2) Counterdrill the holes for CR 2839-5-6 rivets as instructed in Chapter "Riveting", Section 70-50-50 : "Joints Made by the Use of Cherry-Lock Blind Rivets", and as illustrated in Fig. 401.

G. Deburring

Unpin the doublers, and deburr the rivet holes in the doublers, reinforcement plates and Stressskin panel as directed in Chapter "Riveting", Section 70-50-50.

H. Mounting doublers and reinforcement plates

- (1) Pin the doublers on to the elevon top.

78-13-01

REP 29-190-16

Page 403

Jan 31/81

OLYMPUS 593

MK.610-14-28

OVERHAUL

- (2) Position the reinforcement plates in the inner part of the elevon.
- (3) Mount the reinforcement-plate fasteners as shown in Fig. 401, and instructed in Chapter "Riveting", Section 70-50-50 : "Joints Made by Cherry-Lock Blind Rivets".
- (4) Rivet the doublers on round their circumferences as instructed in Chapter "Riveting", Section 70-50-50, and illustrated in Fig. 401.
- (5) Check the riveting on doublers and reinforcement plates as instructed in Chapter "Riveting", Section 70-50-85 : "Joints Made by the Use of Cherry-Lock Blind Rivets".

I. Blanking access openings

Mount the blanking plates as shown in Fig. 401, sheet 8, and as described hereunder :

- (1) Join the angle-section assy and the cover together by means of a bolt.
- (2) Bring the leading edges into contact by screwing in the bolt.
- (3) Mount the blanking plates and lock the bolt. Torque bolt to 0,90 m. Kg (78 in. lbs).

HI-LOCK screw HLN1G6	No. 649-785-048-0

Loctite 307 bonding agent (P 502)

A. Removing the existing fixings

Take down the existing attachment items located in the area to be repaired as indicated in figure 402 and instructed in the following chapters of the Standard Practices manual :

- 70-50-10 For rivets fixing the NAS anchor nuts
- 70-50-40 For HI-LOCK screws
- 70-50-60 For blind bolts

B. Removing the barrel suspension link

Take down the link and its brackets (supporting yokes) as indicated in REP 29-190-8 "Repair of Barrel Suspension Links".

C. Repairing the doublers

- (1) From sheet metal Z8 CND 15 (P 3305), thickness 1,2 mm (0.047 in.), pre-cut the doublers "2", "3" and "4" to the following dimensions :

- . "2" = 320 mm (12.6 in.) X 180 mm (7.08 in.) approx.
- . "3" = 320 mm (12.6 in.) X 65 mm (2.56 in.) approx.
- . "4" = 320 mm (12.6 in.) X 300 mm (11.8 in.) approx.

- (2) Shape the doubler to match the panel contour.

78-13-01

REP 29-190-17

Page 402

Apr 30/93

OLYMPUS 593

MK.610-14-28

OVERHAUL

- (3) Position the doublers "2" and "4" on the panel. On these doublers, center punch the location of holes located at both ends and the location of all the holes in the rear edge.
- (4) Fit the doublers to the dimensions shown on figure 404.
- (5) Heat treat the three doublers per methods M 822 and M 821 in chapter 70-45-10 of the Standard Practices manual.
- (6) Re-shape the doublers, if required.
- (7) Position the doublers "2" and "4" and counterdrill the holes identified in figure 404 as follows :
 - (a) Holes for HI-LOCK screws HL 40-5 : to $4,17 \begin{smallmatrix} +0,1 \\ -0 \end{smallmatrix}$ mm
(0.164 - 0.168 in.) dia.
 - (b) Holes for HI-LOCK screws HL 40-6 : to $4,83 \begin{smallmatrix} +0,1 \\ -0 \end{smallmatrix}$ mm
(0.190 - 0.194 in.) dia.
 - (c) Holes for blind bolts PLT 220-6 : to $5,05 \begin{smallmatrix} +0,08 \\ -0 \end{smallmatrix}$ mm
(0.199 - 0.202 in.) dia. Take down the doublers and deburr holes.
- (8) Position and pin the doublers on to the panel.

D. Drilling the holes accommodating the delamination restraining screws

- (1) On the panel, center punch the location of holes a and b (see figure 405, sheets 1 and 2).

NOTE : The dimensions are given for guidance only as each hole is to be centered in one cell.

- (2) Drill through both the panel and the doublers "2" and "4" the holes a and b and deburr.
- (3) Position doubler "3" on to the two others. Center punch the location of holes marked b on this same doubler.
- (4) Take down the doubler, drill the above center punched holes and deburr.

78-13-01

REP 29-190-17

Page 403

Sep 30/78

OLYMPUS 593

MK.610-14-28

OVERHAUL

(5) Pin doubler "3" on to the two others.

E. Preparing the parts in view of installation of the frames

- (1) From sheet metal Z8 CND 15 (P 3305), thickness 1,2 mm (0.047 in.) cut out and put to shape and dimensions the following parts :
 - (a) the web 1 as per figure 406 (sheet 1).
 - (b) the two ribs 5 and rib 16 as per figure 406 (sheet 2).
 - (c) the two angle sections 6 and angle section 17 as per figure 406 (sheet 2).
 - (d) the two stringers 7 and stringer 18 as per figure 406 (sheet 3).
 - (e) the stringers 10 and 11 as per figure 406 (sheet 4).
 - (f) the two ribs 12 as per figure 406 (sheet 6).
 - (g) the stringers 14 and 20 as per figure 406 (sheet 5).
- (2) From sheet metal T 40 (P 3340), of thickness given for each part, cut out and machine the shims as instructed below :
 - (a) from a 4 mm (0.157 in.) thick sheet metal, cut out the three skew shims 8 as per figure 406 (sheet 7).
 - (b) from a 4 mm (0.157 in.) thick sheet metal, cut out the three skew shims 9 as per figure 405 (sheet 4).
 - (c) from a 1,6 mm (0.063 in.) thick sheet metal, cut out a shim 13 for each attachment within the rear edge of the repaired zone, as per figure 406 (sheet 7).

78-13-01

REP 29-190-17

Page 404

Sep 30/78

OLYMPUS 593

MK.610-14-28

OVERHAUL

- (d) from a 1,6 mm (0.063 in.) thick sheet metal, cut out the shim 15, as per figure 406 (sheet 5).
- (e) from a 0,8 mm (0.031 in.) thick sheet metal, cut out the shim 19, as per figure 406 (sheet 7).

- (3) Subject all parts cut out and shaped under paragraph E (1) to heat treatment per methods M 822 and M 821 in chapter 70-45-10 of the Standard Practices manual.
- (4) After heat treatment, re-shape the parts if necessary.

F. Drilling the front section of the frames.

- (1) Position web 1 on both the nozzle throat section and the panel as indicated in figure 405 (sheets 3 and 4).
- (2) Counterdrill the holes marked C through web 1, the panel and doubler 4 (figure 405, sheet 1 and figure 406, sheet 1). Deburr holes.
- (3) Pin web 1 on to the panel.
- (4) Counterdrill web 1 together with the throat section, the holes marked s but the two providing for attachment of stringers 10 and 11 (figure 405, sheet 3). Deburr holes.
- (5) Between web 1 and throat section, sandwich the shims 19 (figure 405, sheets 6 and 7) then, pin the web on to the nozzle throat section.
- (6) Locate the NAS anchor nuts on angle sections 6 and 17 (figure 406, sheet 2).
- (7) Install the rivets as indicated in chapter 70-50-10 of the Standard Practices manual.
- (8) Inspect the riveting as instructed in chapter 70-50-81 of the Standard Practices manual.
- (9) On the webs 5 and 16 drill the holes through the face in contact with the panel (see figure 406, sheet 3). Deburr holes.

- (10) Position angle sections 6 and 17 and secure them to the convergent channel section using the NAS anchor nut (figure 405, sheet 4).
- (11) Position ribs 5 and 16 on the panel together with the corresponding angle sections (figure 405, sheets 4 and 6).
- (12) Drill, through the panel and the doublers, the ribs-to-panel attachment holes, identified c and d on figure 405 (sheet 1). Deburr holes.
- (13) Pins the ribs 5 and 17 on to the panel while sandwiching skew shims 8 and 9. Counterdrill holes identified e and f. Deburr, then pin the ribs and the shims.
- (14) Using angle sections 6 and 17, counterdrill holes identified h and i through the ribs 5 and 16 (figure 405, sheet 4 and figure 406, sheets 2 and 3). Deburr holes.
- (15) Position stringer 7 and stringer 18 on the assembly. Using the ribs and the corresponding angle sections, counterdrill the stringers (see figure 405, sheets 4 and 6). Deburr holes then, pin the stringers.

G. Drilling the rear sections of the frames

- (1) Position ribs 12 on the rear-frame mount (fitting) and on the panel then counterdrill the holes identified m through the ribs (figure 405, sheet 5). Deburr holes and pin ribs.
- (2) Using the panel and doubler 4, counterdrill holes identified c through the ribs (figure 405, sheet 2). Deburr holes.
- (3) Pin ribs 12 on to the panel.
- (4) Position the stringers 10 and 11 on web 1 and ribs 12 (figure 405, sheets 3 and 5).
- (5) In a single operation, counterdrill holes identified H through both the stringers and the ribs 12 (figure 405, sheet 5). Deburr, then pin the stringers.

OLYMPUS 593

MK.610-14-28

OVERHAUL

PRINTED IN FRANCE

- (6) In a single operation, counterdrill holes identified i through both the stringers 10 and 7, using the web 1 ; then, both the stringers 11 and 7, using the web 1 (figure 406, sheets 3, 4, 5). Deburr holes and pin the stringers.
- (7) Position the stringer 14 on the web 1 with the shim 15 and counterdrill the stringer and the shim altogether using the existing frame then, pin on.
- (8) Counterdrill the holes identified i through the stringers 14 and 18 (figure 405, sheet 3). Deburr holes and pin the stringers.
- (9) Position the stringer 20 on the web 1 and, using the frame, counterdrill holes identified l and m through the stringer (figure 405, sheet 7). Deburr and pin the stringer.
- (10) Counterdrill the holes identified i (figure 405, sheet 3) through the stringer 20 and the web 1. Deburr and pin on.
- (11) Counterdrill the holes identified s through the stringers 10, 11, 14 using web 1 and nozzle throat section (figure 405, sheet 3). Deburr holes.
- (12) Take down the parts. On the panel, counterbore the holes identified a-b-c-d-e-f-g to the following diameter :

$$5,5 \begin{smallmatrix} + \\ 0 \end{smallmatrix} \begin{smallmatrix} 0,1 \\ \end{smallmatrix} \text{ mm (0.212 - 0.216 in.)}$$

CAUTION : DO NOT REBORE THROUGH THE OUTER SKIN (FACE SHEET) OF PANEL (SEE FIG. 405, SHEET 8).

- (13) Locate the spacers into these holes using Loctite 307 bonding agent (P 502) to hold them fast upon installation of the attaching hardware (fixings).

H. Fixing the doublers and frames

- (1) Again, pin all the parts making up the repair altogether.
- (2) Unpin the pins, one-by-one, each time replacing it by the fixing required at the subject location. Refer to figures 404 and 405 for the location and identification of each fixing.
These fixings are to be installed as instructed in chapters 70-50-40 and 70-50-60 of the Standard Practices manual.

- (3) Re-install the link and its brackets as indicated in REP 29-190-8.

NOTE : For the re-insertion of the SPC shim between the panel and the supporting yoke, allow for the doubler thickness : 1,2 mm (0.047 in.) which will have to be machined out from the shim.

- (4) Inspect the installed fixings as indicated in chapters 70-50-84 and 70-50-86 of the Standard Practices manual.

or Bolt NAS 1578 C 4T 7		(649-781-441-0)

A. Checking the extent of damage

- (1) Perform a coin tapping test to ascertain the extent of the core-to-face sheet separation.
- (2) Carry out a radiographic inspection, using an X-ray unit complete with a long anode, as instructed in the Standard Practices Manual, Chapter section 70-20-30, as shown in Fig. 401, with the following remarks

78-13-01

REP 29-190-18

Page 401

Jan 31/81

OLYMPUS 593

MK.610-14-28

OVERHAUL

taken into account :

- (a) Make a straight shot of each area (see example of point B in area 2 - Fig. 402).
 - (b) Make two shots at 15° of each area to expose the delaminated segment (see example of points C and D in area 2 - Fig. 402).
- (3) Depending on the extent of damage, there are two possible forms of repair applicable to each area.
- (a) A minor extent of separation with wrinkling, limited to the inner panel face and not involving destruction of the ribbon, or else (separation alone : Repair by application of an internal doubler).
 - (b) Extensive separation on both faces, with the ribbon not destroyed, with or without wrinkling on the inner face : Repair by applying two doublers.

NOTE : Heavy damage occurring concurrently in areas 1 and 2 (see Fig. 401) is to be dealt with by the use of one outer doubler in both types of repair. The same applies to areas 2 and 3, 3 and 4, 5 and 6, 6 and 7, and 7 and 8.

B. Repair by application of one doubler to the inner panel face (appropriate to areas 1 through 8).

(1) Making a doubler

- (a) Lightly rub the panel with a fine emery cloth . until the honeycomb pattern shows through.
- (b) Stick a sheet of tracing paper on the panel and trace out the honeycomb cell outlines, the outer contours of the doubler and the locations of the retaining holes. Drill-mark these hole locations on the panel.

NOTE : Each hole must invariably lie at the centre of a cell.

- (c) Stick the tracing paper on a plate made from Z 8 CND 15 sheet metal P3305 of 1,2 mm (0.047 in.) thickness, previously shaped to the contours of the panel : next trace out the doubler outline.

78-13-01

REP 29-190-18

Page 402

Jan 31/81

OLYMPUS 593

MK.610-14-28
OVERHAUL

- (d) Cut out the doubler, and mark out the area around the wrinkled surface as shown in Fig. 403, Sheet 1 or 2 depending on the area concerned).

(2) Drilling the panel and doubler

- (a) Drill out the holes in the panel to a dia. of $4,17 + 0,1 \text{ mm}$ (0.164 in.), and deburr.
 $+ 0$ (0.168 in.)
- (b) Put the doubler in position on the panel and drill-mark the retaining-hole locations.
- (c) Take off the doubler and drill its marked-out holes to a dia of $4,17 + 0,1 \text{ mm}$ (0.164 in.),
 $+ 0$ (0.168 in.), deburr.
- (d) Bore out the spacer holes in the panel to a dia. of $5,5 + 0,1 \text{ mm}$ (0.216 in.)
 $+ 0$ (0.220 in.) as shown in Fig. 403, Sheet 3 of 6.

NOTE : Do not pierce the outer skin of the panel.

(3) Mounting on the doubler

- (a) Fix the spacers in the panel holes with Loctite 307 (P502) to hold them fast while fitting the Hi-Lok bolts.
- (b) Locate and pin the doubler on the panel.
- (c) Fasten the doubler on with Hi-Lok bolts (See Fig. 403) as instructed in the Standard Practices Manual, Chapter Section 70-50-40, and below :
- 1 Use HL 144-5-12 or, exceptionally, HL 40-5-7 bolts, with a thrust washer placed underneath the bolt head.
- 2 Remove the pins one by one, putting a Hi-Lok bolt in the place of each.
- (d) Check the way the Hi-Lok bolts have been applied, as instructed in the Standard Practices Manual, Chapter Section 70-50-84.

78-13-01

REP 29-190-18

Page 403

Jan 31/81

C. Repair by application of two doublers (as appropriate to areas 2-3-6-7, Fig. 401)

(1) Making up the doublers

- (a) Lightly rub the panel with a fine emery cloth so as to make the honeycomb pattern show through.
- (b) Stick a sheet of tracing paper on the outer skin of the panel and trace out the cell outlines, the locations of the existing fastenings, the outer contours of the doublers, and the locations of the new retaining holes (see Fig. 404).

NOTE : Each hole must invariably lie at the centre of a cell.

- (c) Remove the existing fasteners from the panel, as shown in Fig. 404 and directed in the Standard Practices Manual, Chapter Sections
 - 70-50-40 for fasteners marked B, C and H
 - 70-50-60 for those marked D.

Also remove the screws marked E (cross-slotted screws of the "Torq Set" type).

- (d) Cut out the outer doubler to measure approx. 285 mm (11.22 in.) by 310 mm (12.2 in.) Shape it to fit the panel contours.
- (e) Stick the tracing paper on that outer-doubler side coming into contact with the panel. Drill-mark the locations of the existing fasteners, and trace out the outline of the doubler.
- (f) Stick the tracing paper on a plate made from Z 8 CND 15 sheet metal (P3305) 1,2 mm (0.047 in.) in thickness. Trace out the outline of the inner doubler.
- (g) Cut out the doublers, and mark out the area around the wrinkled segment on the inner doubler in the way shown in Fig. 404.
- (h) Using Z8 CND 15 sheeting (P3305) 1,2 mm (0.047 in.) in thickness, machine a thrust shim as shown in Fig. 404, Sheet 5.

OLYMPUS 593

MK.610-14-28

OVERHAUL

(2) Drilling the panel and doublers.

- (a) Pre-drill the panel holes marked A, F and G to a dia. of $3 \pm 0,1$ mm $\begin{matrix} (0.114 \\ (0.122 \text{ in.}) \end{matrix}$, and deburr.
- (b) Put the inner doubler in position on the panel. Drill-mark the locations of A holes on the doubler.
- (c) Take off the doubler, and drill out the A holes so marked to a dia. of $4,17 \begin{matrix} + 0,1 \\ + 0 \end{matrix}$ mm $\begin{matrix} (0.164 \\ (0.168 \text{ in.}) \end{matrix}$.
- (d) Drill out the following holes in the outer doubler :
 - 1 B and E holes to $6,35 \begin{matrix} + 0,1 \\ 0 \end{matrix}$ mm $\begin{matrix} (0.250 \\ (0.254 \text{ in.}) \end{matrix}$ dia.
 - 2 C and D holes to $4,83 \begin{matrix} + 0,1 \\ 0 \end{matrix}$ mm $\begin{matrix} (0.190 \\ (0.194 \text{ in.}) \end{matrix}$ dia.
 - 3 H holes to $4,17 \begin{matrix} + 0,1 \\ 0 \end{matrix}$ mm $\begin{matrix} (0.164 \\ (0.168 \text{ in.}) \end{matrix}$ dia.
 Deburr.
- (e) Pin the outer doubler onto the panel through the existing holes, and counterdrill the D holes on the panel to a dia. of $4,83 \begin{matrix} + 0,1 \\ 0 \end{matrix}$ mm $\begin{matrix} (0.190 \\ (0.194 \text{ in.}) \end{matrix}$. Drill-mark the locations of A, F and G holes on the doubler.
- (f) Remove the doubler, drill out its A, F and G holes to a dia. of $4,17 \begin{matrix} + 0,1 \\ 0 \end{matrix}$ mm $\begin{matrix} (0.164 \\ (0.168 \text{ in.}) \end{matrix}$, and deburr.
- (g) Place the thrust shim on the panel. Drill-mark the locations of F holes on it.
- (h) Remove the shim and drill out the F holes so marked. Deburr.
- (i) Bore out the A, F and G holes in the panel to a dia. of $4,17 \begin{matrix} + 0,1 \\ 0 \end{matrix}$ mm $\begin{matrix} (0.164 \\ (0.168 \text{ in.}) \end{matrix}$.

OVERHAUL

Next bore out the "A" and "G" holes to the diameters of the spacer holes, as indicated in Fig. 404, Sheet 3.

NOTE : Do not pierce the outer panel skin.

(3) Mounting on the doublers

- (a) Fix the spacers into the panel holes with Loctite 307 (P502) to hold them fast while mounting the Hi-Lok bolts.
- (b) Fit tapered washers or heads of discarded fasteners into the panel recesses or countersinks. Fix them fast with Loctite 307 (P502).
- (c) Locate and pin the doublers on the panel.
- (d) Secure the doublers onto the panel as shown in Fig. 404 and instructed in the Standard Practices Manual, Chapter Section 70-50-40.
- (e) For the holes marked E, there are two alternative modes of fastening, namely (a) by 649-781-XXX-0 100° flush-head screws, cross-slotted, Type "Torq Set", together with 002-004-005 washers, or (b) by NAS 1578 C-4T screws with cross-slotted round heads, Type "Torq Set".
For mounting, coat the screws with C 200 anti-seizing lubricant (P209) ; tightening torque to applied : 0,34 to 0,46 DaN.m (30 to 40 lb. in.).
- (f) Check the way the Hi-Lok bolts have been mounted, as instructed in the Standard Practices Manual, Chapter Section 70-50-84.

D. Repair by application of two doublers (as appropriate to areas 1, 4, 5 and 8, Fig. 401).

(1) Making up the doublers

- (a) Lightly rub the panel with a fine emery cloth so as to make the honeycomb pattern show through.
- (b) Stick a sheet of tracing-paper on the outer skin of the panel, and trace out the panel cell contours, the locations of the existing fastenings, the outlines of the doublers, and the locations of the new retaining holes (See Fig. 405).

78-13-01

REP 29-190-18

Page 406

Jan 31/81

NOTE : Each hole must invariably lie at the centre of a cell.

- (c) Remove the existing fasteners from the panel as illustrated in Fig. 405 and instructed in the Standard Practices Manual, Chapter section 70-50-40, for fasteners marked "B".
 - (d) Using Z 8 CND 15 sheet metal (P3305) of 1,2 mm (0.047 in.) thickness, shape the doublers to the panel contours and cut them out as shown in Fig. 405.
 - (e) Stick the tracing paper on that outer-doubler side coming into contact with the panel. Drill-mark the fastener locations.
- (2) Drilling the panel and doublers
- (a) Pre-drill the C holes in the panel to a dia. of $3 \pm 0,1 \text{ mm}$ (0.114 in.), and deburr.
 - (b) Put the inner doubler in position on the panel. Drill-mark the locations of the "C" holes on the doubler.
 - (c) Take off the doubler, and drill out the "C" holes so marked to a dia. of $4,17 \pm 0,1 \text{ mm}$ (0.164 in.).
 - (d) Drill the following holes in the outer doubler :
 - 1 A holes to $6,35 \pm 0,1 \text{ mm}$ (0.250 in.) dia.
 - 2 B holes to $4,83 \pm 0,1 \text{ mm}$ (0.190 in.) dia.
 Deburr.
 - (e) Pin the outer doubler onto the panel. Drill-mark the "C"-hole locations on the doubler.
 - (f) Remove the doubler. Drill out the "C" holes so marked to a dia. of $4,17 \pm 0,1 \text{ mm}$ (0.164 in.). Deburr.
 - (g) Bore out first the panel "C" holes to a dia. of $4,17 \pm 0,1 \text{ mm}$ (0.164 in.), then the spacer holes as shown in Fig. 405, sheet 2. Deburr.

78-13-01

REP 29-190-18
Page 407
Jan 31/81

NOTE : Do not pierce the outer panel skin.

(3) Mounting on the doublers

- (a) Fix the spacers into the panel holes with Loctite 307 (P502) so as to hold them fast while fitting in the Hi-Lok bolts.
- (b) Fit tapered washers or heads of discarded fasteners into the panel recesses. Fix them fast with Loctite 307 (P502).
- (c) Locate and pin the doublers on the panel.
- (d) Secure the doublers onto the panel as directed in Fig. 405 and in the Standard Practices Manual, Chapter section 70-50-40.
- (e) Check the way the fasteners have been mounted as instructed in the Standard Practices Manual, Chapter section 70-50-84.

Spacer No. 002-004-073-1
Spacer No. 002-004-113-1

A. Assessing the extent of the defect

Determine the extent of the delamination through a tap coin test.

Depending on the extent of the defect, two repair modes are possible :

- (1) Local repair through the installation of a doubler covering the defect only.
- (2) Repair using a doubler covering the panel aft zone in totality.

B. Repair mode 1 : Local repair through installation of a doubler covering the defect only.

- (1) Preparing the doubler
 - (a) Using a fine grain emery cloth, sand lightly the panel so that the mesh (cell) patterns show up.
 - (b) Mark the location of doubler attachment (fixing) holes on the panel and center punch the hole locations.

78-13-01

REP 29-190-19

Page 401

Sep 30/78

OLYMPUS 593

MK.610-14-28

OVERHAUL

NOTE : Each hole to be centered within one cell.

- (c) Drill 2,5 mm (0.10 in.) dia. pilot holes through the panel.
- (d) Transfer the hole locations on a stabilene tracing paper.
- (e) From sheet metal material T60 (P3344), pre-cut the doublers in the thicknesses appropriate to the type of fixing to be used ; then curve these doublers to match the panel contour. External doubler : thickness 1,2 mm (0.047 in.) or 1,5 mm (0.059 in.) ; internal doubler : thickness 1,2 mm (0.047 in.) or 1 mm (0.039 in.). Refer to figure 402.

NOTE : For repair involving the lower panels, shape the doublers immediately above the panel weld line so as to avoid any doubler/panel weld line interference. (Refer to figure 402, sheet 7).

- (f) Stick the tracing paper on the external doubler. Center punch the hole locations and trace the outline of the external doubler.
- (g) Clip together the external and internal doublers and drill 2,5 mm (0.010 in.) dia. pilot holes through them.
- (h) Cut the internal and external doublers to dimensions and, working lengthwise, machine their edges as indicated in figure 402.

NOTE : The internal doubler may be made in several strips to ease its installation. Fit the doubler until proper contact is obtained with the angle section.

- (i) Offer up the internal and external doublers on the panel and check for alignment of holes. If required, rework holes in the doublers until good alignment is obtained.

(2) Drilling the doublers and panel

- (a) Pin the doublers on to the panel then drill 4 mm (0.157 in.) dia. holes through the assembly.
- (b) Take down the doublers and deburr holes in doublers and panel.

78-13-01

REP 29-190-19

Page 402

Sep 30/78

OLYMPUS 593

MK.610-14-28
OVERHAUL

- (c) Offer up the doublers on the panel and check again for hole alignment.
If required, rework holes in doublers until proper alignment is obtained.
- (d) Re-position the doublers, pin them on to the panel and ream holes to $D = 4,47 + 0,1 \text{ mm}$ ($0.176 - 0.180 \text{ in.}$).
- (e) Take down the doublers and deburr all the mating parts carefully.
- (f) Within the delaminated zone, drill $6 + 0,1 \text{ mm}$ dia. holes ($0.236 - 0.240 \text{ in.}$) through the panel outer face-sheet to provide for passage of spacers. Deburr carefully.

CAUTION : DO NOT DRILL THROUGH THE PANEL INNER FACE-SHEET.

(3) Installing the doublers

- (a) Locate the spacer and hold them fast using Loctite 307 bonding agent (P 502).
- (b) Position the doublers and pin them on to the panel.
- (c) Secure the doublers using blind rivets as instructed in chapter 70-50-50 of the Standard Practices manual and as indicated in figure 402.
- (d) Inspect the installed rivets as instructed in chapter 70-50-85 of the Standard Practices manual.

C. Repair mode 2 : Repair using a one-piece doubler covering the panel aft zone in totality.

(1) Preparing the doubler

- (a) Grind out the rivets identified on figure 403 and 404 providing for attachment of external doublers on to the nozzle framework.

NOTE : Ascertain that the rivet holes are not out-of-round. Otherwise, provide for installation of oversize dia. rivets.

OVERHAUL

- (b) Using a fine grain emery cloth, sand lightly the panel so that the mesh (cell) patterns show up.
- (c) Mark on the panel, the location of doubler attachment holes (fixings) and center punch the hole locations. (Refer to figures 403 and 404).

NOTE : Each hole to be centered in one cell.

- (d) Drill 2,5 mm (0.10 in.) dia. pilot holes through the panel.
- (e) On a Stabilene tracing paper, transfer the location of holes providing for attachment of the doublers to the Stresskin panel.
- (f) From sheet metal material T60 (P 3344), 1,5 mm (0.060 in.) thick, pre-cut the external doubler and then curve it to match the panel contour.
- (g) Offer up the external doubler on the panel and, using a scribe, transfer mark on the doubler the locations of rivet holes (rivets machined out in step C.(a)) existing in one frame and in the two angle sections located on the frame side.
- (h) Remove the doubler from the panel and drill 2,5 mm (0.10 in.) dia. holes through the hole locations marked in the above step.
- (i) Position the doubler on the panel and check for hole alignment.
If required, rework holes in the doubler until proper alignment is obtained.
- (j) Drill the holes to 4 mm (0.157 in.) dia.
- (k) Pin the doubler on to the frame and the two angle sections and press it correctly against the panel.
Again, carry out steps (g) through (j) to drill the holes in line with the second frame and the two other angle sections.
- (l) Stick the Stabilene tracing paper on the external doubler and center punch the location of all the holes providing for attachment of doublers to the Stresskin panel.

OVERHAUL

NOTE : Position the Stabilene tracing paper relative to the holes located in line with the two frames and angle sections and which have been previously drilled in the doubler.

- (m) From sheet metal material T60 (P 3344) 1 mm (0.040 in.) thick, pre-cut the whole set of internal doublers and curve them to match the panel contour.
- (n) Clip together the internal and external doublers and, through them, drill pilot holes to the following diameters :
 - 1. 2,5 mm (0.100 in.) in the lateral zones
 - 2. 4 mm (0.157 in.) in the central zones.
- (o) Trace the outline of internal and external doublers relative to the hole locations and as indicated in figures 403 and 404.
Cut the doublers to dimensions and, working lengthwise, machine their edges as indicated in figures 403 (Sheet 14) and 404 (Sheet 15).
- (p) Position the internal and external doublers on the panel and check for hole alignments.
If required, rework holes in doublers until proper alignment is obtained.

(2) Drilling the doublers and panel

NOTE : For repair involving the lower panels, it may be necessary to partially disassemble the panel and the rear frame to obtain passage clearance for the central zone internal doublers at the location of the drain-tube support clamp.

- (a) Pin the doublers on to the panel and drill the assembly to 4 mm (0.157 in.) dia.
- (b) Take down the external doubler and the lateral internal doublers and deburr both these and the panel.

NOTE : The central internal doublers are to be deburred in their "as-installed" position as indicated in chapter 70-50-50.

MK.610-14-28

OVERHAUL

- (c) Pin the doublers on to the panel and ream the assembly to the following dia. :
 $4,47 \begin{smallmatrix} + 0,1 \\ + 0 \end{smallmatrix}$ mm (0.176 - 0.180 in.)
- (d) Take down the doublers and deburr all the part carefully.
- (e) Within the delaminated zone as well as directly in line with the attachment holes previously accommodating the PLT screws, drill the panel outer face-sheet to the following diameters :
 - 1. $6 \begin{smallmatrix} + 0,1 \\ + 0 \end{smallmatrix}$ mm (0.236 - 0.240 in.) for the spacers
No. 002-004-073-1 (Refer to figure 405).
 - 2. $8 \begin{smallmatrix} + 0,1 \\ + 0 \end{smallmatrix}$ mm (0.315 - 0.319 in.) for the spacers
No. 002-004-113-1 (Refer to figure 405).

CAUTION : DO NOT DRILL THROUGH THE PANEL INNER FACE-SHEET.

(3) Installing the doublers

- (a) From sheet metal material T60 (P 3344) 5,2 mm (0.204 in.) thick, or from two 2,6 mm (0.102 in.) sheet metal plates, machine two shims as indicated in figure 403 (Sheet 12) and in figure 406.
- (b) Offer up the external doubler on the panel and fit the shim so as to ensure proper contact of doubler in the rear frame zone.
- (c) Locate the spacers maintaining them with Loctite 307 bonding agent (P 502).
- (d) Re-position the doublers and pin them on to the panel.
- (e) Secure the doublers using blind rivets, as instructed in chapter 70-50-50 of the Standard Practices manual and as indicated in figures 403 and 404.

NOTE : Secure the external doubler first to the nozzle framework.

- (f) Inspect the installed rivets as instructed in chapter 70-50-85 of the Standard Practices manual.

A. Introduction.

This procedure is to be used for the repair of delaminations in the panels of central wall, in the primary nozzle centering support zone on condition that the zone in need of repair is within the limits specified in figure 401.

78-13-01

REP 29-190-20

Page 401

OLYMPUS 593

MK.610-14-28

OVERHAUL

B. Repair of delamination in the upper part of the panel.

(1) Removal of existing fitting attachments.

- (a) Remove fitting attachments from panel as shown in figure 402 and specified in the following standard practices :

1 chapter 70-50-30 for fitting attachments marked "C" and "E".

2 chapter 70-50-40 for fitting attachments marked "D", "F", "G", "H", "J", "K".

(2) Locating attachment holes for doublers.

- (a) Lightly rub the internal panel of the barrel with a very fine emery cloth until the cellular structure of the zone to be repaired is visible.

- (b) Centre mark the positions of holes "A" and "B" on the panel (see figure 402). Drill these holes in the panel, dia. $3 \pm 0,1$ mm (0.114 - 0.122 in.) and deburr.

NOTE : It is essential that each hole be located in the centre of a cell.

- (c) Stick a sheet of stabilene tracing paper to the panel inside of the barrel. On this tracing sheet, centre mark the positions of attachment holes and trace the outlines of the internal doubler and of the foil compensating for the chemical milling of the panel.

NOTE : Before sticking the stabilene make provision for the raised heads of fitting attachments not removed.

- (d) Stick a sheet of stabilene to the external face of the panel, centre mark position of holes "A" and "C" and trace the outlines of the external doubler on this sheet.

(3) Preparation of doublers, shims and foils.

- (a) From sheet metal Z8 CND 15 (P 3305) thickness 1 mm (0.039 in.), cut out :

78-13-01

REP 29-190-20

Page 402

Jun 15/82

OLYMPUS 593

MK.610-14-28

OVERHAUL

- 1 internal doubler to dimensions 240 mm (9.45 in.) X 310 mm (12.2 in.) approx.
 - 2 external doubler to dimensions 250 mm (9.84 in.) X 120 mm (4.72 in.) approx.
 - 3 shim as shown in figure 403 sheet 3 of 3. Pre-fit dimensions (to be reworked if necessary) 230 mm (9.05 in.) X 20 mm (0.78 in.).
- (b) From sheet metal Z8 CND 15 (P 3305) thickness 1,8 mm (0.07 in.) cut out shim as shown in figure 403 sheet 2 of 3. Pre-fit dimensions 317 mm (12.5 in.) X 25 mm (1.0 in.) approx.
 - (c) From sheet metal Z8 CND 15 (P 3305) thickness 0,3 mm (0.012 in.) cut out the first foil to 258 mm (10.15 in.) X 120 mm (4.72 in.) and the second to 290 mm (11.41 in.) X 27 mm (1.06 in.).
 - (d) Shape the doublers and foils according to the outline of the panel (see figure 402 sheet 2 of 4).
 - (e) Stick the stabilene to the side of the internal doubler which will be in contact with the panel. Trace out the outlines of the doubler and on it centre mark the positions of fitting attachments not removed in the zone of overlay of panels.
 - (f) Stick the second stabilene sheet on the side of the doubler which will be in contact with the panel. Proceed in the same way for the internal doubler.
 - (g) Machine the outlines of the two doublers and radius the ends in contact with the panel as shown in figure 403.
 - (h) Drill the previously centre marked holes in the doublers to dia. 18 mm (0.70 in.) and deburr.
 - (i) Stick stabilene sheet to the side of the foils which will be in contact with the panel. Trace out and machine the outlines of the foils.

OLYMPUS 593

MK.610-14-28
OVERHAUL

- (j) Apply heat treatment to the two doublers according to procedures M 822 and 821 of chapter 70-45-10 of standard practices.
 - (k) Reshape the doublers (see figure 402).
- (4) Drilling the doublers (see figure 402).
- (a) Position the internal doubler on the panel, centre mark the positions of the four holes at the corners.
 - (b) Remove the doubler. Drill the four holes to dia. $3 \pm 0,1 \text{ mm}$ (0.114 - 0.122 in.) and deburr.
 - (c) Offer up the internal doubler to the panel, check alignment of the holes. If necessary, rework the doubler until alignment is correct.
 - (d) Remove the internal doubler, drill the four holes marked "D", "F", "H", "J", to dia. $4,83 \begin{smallmatrix} + 0,1 \\ + 0 \end{smallmatrix} \text{ mm}$ (0.190 to 0.194 in.) and deburr.
 - (e) Pin the internal doubler on the panel through the four holes. Centre mark the positions of all the other holes on the doubler.
 - (f) Remove the doubler. Drill all the holes to dia. $3 \pm 0,1 \text{ mm}$ (0.114 - 0.122 in.) and deburr.
 - (g) Pin the internal doubler on the panel to check alignment of the holes. If necessary, rework the holes until alignment is correct.
 - (h) Remove the doubler. Drill.
 - 1 Holes marked "C", "D", "E", "F", "G" to dia. $4,83 \begin{smallmatrix} + 0,1 \\ + 0 \end{smallmatrix} \text{ mm}$ (0.190 - 0.194 in.).
 - 2 Holes marked "K" to dia. $6,35 \begin{smallmatrix} + 0,1 \\ + 0 \end{smallmatrix} \text{ mm}$ (0.250 - 0.254 in.) and deburr.

78-13-01

REP 29-190-20

Page 404

OLYMPUS 593

MK.610-14-28
OVERHAUL

- (i) Pin the doubler on the panel. In the doubler and the panel, counterdrill hole marked "A" and "B" to diameter $4,17 + 0,1$ mm (0.164 - 0.168 in.). Remove the doubler and deburr.
- (j) Position the foils on the internal doubler.
- 1 In the first foil, counterdrill the holes "A" to dia. $4,17 + 0,1$ mm (0.164 - 0.168 in.).
- 2 In the second foil, counterdrill the hole marked "B" to dia. $4,17 + 0,1$ mm (0.164 - 0.168 in.) and the hole marked "D" to dia. $4,83 + 0,1$ mm (0.190 - 0.194 in.). Remove and deburr.
- (k) Position shim on internal doubler, mark positions of openings and attaching holes.
- (l) Remove. Drill openings to dia. 18 mm (0.70 in.) and attaching holes to dia. $4,83 + 0,1$ mm (0.190 - 0.194 in.) and deburr.
- (m) Position second shim on internal doubler and counterdrill the holes marked "B" on the shim to dia. $4,17 + 0,1$ mm (0.164 - 0.168 in.). Remove and deburr.
- (n) Position external doubler on the panel. Locate positions of holes "A" and "C".
- (o) Remove and counterdrill the holes to dia. $3 + 0,1$ mm (0.114 - 0.122 in.) in the doubler.
- (p) Offer external doubler up to panel. Check alignment of holes. If necessary, rework doubler until alignment is correct.

78-13-01

REP 29-190-20

Page 405

Jun 15/82

OLYMPUS 593

MK.610-14-28
OVERHAUL

(g) Remove. In the external doubler drill :

1 holes marked "A" to dia. $4,17 + 0,1$ mm
(0.164 - 0.168 in.).

2 holes marked "C" to dia. $4,83 + 0,1$ mm
(0.190 - 0.194 in.).
Deburr.

(r) On the panel rebores the holes for passage of
spacers (at holes marked "A") to dia.

$5,5 + 0,1$ mm (0.216 - 0.220 in.) and deburr.
 $+ 0$

NOTE : Do not pierce the external skin of
the panel.

(5) Securing doublers.

(a) Install the spacers in their holes with loctite
307 (P 502) to hold them in place during instal-
lation of fitting attachments.

(b) Pin the foils, shims and doublers in position
on the panel.

(c) Secure the assembly as shown in figure 402 and
specified in chapter 70-50-84 of standard
practices.

(d) Check installation of fitting attachments ac-
cording to chapter 70-50-84 of standard
practices.

C. Repair of delamination in lower part of the panel.

(1) Removal of existing fittings.

(a) Remove existing fitting attachments from the
panel as shown in figure 404 and specified in the
following standard practices.

1 chapter 70-50-30 for fitting attachments
marked "D", "E" and "J".

2 chapter 70-50-40 for fitting attachments
marked "F", "G" and "K".

3 chapter 70-50-60 for fitting attachments
marked "L".

OVERHAUL

(2) Locating attachment holes for doublers.

- (a) Lightly rub the internal panel of the barrel with a very fine emery cloth until the cellular structure of the zone to be repaired is visible.
- (b) Centre mark the positions of holes "A", "B" and "C" (see figure 404) on the panel. Drill these holes to dia. $3 \pm 0,1$ mm (0.114 - 0.122 in.) and deburr.

NOTE : It is essential that each hole be located in the centre of a cell.

- (c) Stick a stabilene tracing sheet to the internal panel of the barrel. On this tracing sheets, locate attachment holes and trace the foil compensating for chemical milling of the panel.

NOTE : Before sticking the stabilene make provision for the raised heads of fitting attachments not removed.

- (d) Stick a stabilene sheet to the external face of the panel. Centre mark the positions of holes "A" and "C" on the stabilene. Trace the outline of the external doubler.

(3) Preparation of doublers, shims and foil.

- (a) From sheet metal, Z8 CND 15 (P 3305), thickness 1 mm (0.039 in.), cut out :

1 internal doubler, dimensions 315 mm
(12.4 in.) X 250 mm (9.84 in.) approx.

2 external doubler, dimensions 260 mm
(10.23 in.) X 120 mm (4.72 in.) approx.

3 shim as indicated in figure 403, sheet 3 of 3.
Pre-fit dimensions 230 mm (9.05 in.) X 20 mm
(0.78 in.).

- (b) From sheet metal, Z8 CND 15, thickness 1,8 mm (0.70 in.) cut out and machine shim according to figure 405 sheet 3 of 3. Pre-fit dimensions 272 mm (10.70 in.) X 25 mm (1.0 in.).

OVERHAUL

- (c) From sheet metal 28 CND 15 (P 3305), thickness 0,3 mm (0.012 in.) cut out foil to dimensions 260 mm (10.23 in.) X 95 mm (3.74 in.) approx.
- (d) Shape doublers and foil to outline of panel (see figure 402 sheet 2).

For the operations which follow refer, in the order in which they are given, to paragraphs (a) to (h) of the preceding chapter B (3).

(4) Drilling of doublers.

- (a) On the panels and frames, rebore holes marked "L" to dia. $6,35 + 0,1$ mm (0.250 - 0.254 in.) and deburr.
- (b) Position the internal doubler on the panel. Centre mark the positions of the four corner holes on the doubler.
- (c) Remove the doubler. Drill the four holes in it to dia. $3 \pm 0,1$ mm (0.114 - 0.122 in.) and deburr.
- (d) Offer up the internal doubler to the panel and check alignment of holes. If necessary rework doubler until alignment is correct.
- (e) Remove the internal doubler. Bore holes marked "E" and "H" to dia. $4,83 + 0,1$ mm (0.190 - 0.194 in.), and holes marked "L" to dia. $6,35 + 0,1$ mm (0.250 - 0.254 in.). Deburr.
- (f) Pin internal doubler to panel by means of the four holes. On the doubler centre mark the positions of all the other holes.
- (g) Remove the doubler. Drill all holes to dia. $3 \pm 0,1$ mm (0.114 - 0.122 in.) and deburr.
- (h) Pin the doubler by means of the four corner holes, check alignment of all holes. If necessary rework the doubler until alignment is correct.

A. Introduction

This procedure is to be used for repair of delamination in the pressure area lying outside of the barrel suspension link attachment zones if :

The panel is not pierced.
The deteriorated surface area is less than half of the mesh.

NOTE : Mesh is the area of a panel between two stingers and two transverse frames.

If any of these criteria are not satisfied, inform SNECMA.

78-13-01

REP 29-190-21

OVERHAUL

B. Repair of delamination in zone 1 - Figure 402.

(1) Removal of existing attachment fittings.

- (a) Remove attachment fittings as shown in figure 402 and indicated in the following standard practices:

- 1 Chapter 70-50-30 for attachment fittings marked "D"- "E"- "N".
- 2 Chapter 70-50-40 for attachment fittings marked "G"- "F"- "J"- "H".
- 3 Chapter 70-50-60 for attachment fittings marked "L"- "M".

(2) Locating attachment holes for doublers.

- (a) Lightly rub the internal panel of the barrel with a very fine emery cloth until the cellular structure of the zone to be repaired is visible.
- (b) Centre mark the positions of holes "A" and "C" on the panel (see figure 402). Drill these holes in the panel to dia. $3 \pm 0,1$ mm (0.114 - 0.122 in.) and deburr.

NOTE : It is essential that each hole be positioned in the centre of a cell.

- (c) Stick stabilene tracing paper to internal panel surface. Locate all of the fixing holes on the stabilene tracing paper, and trace the outline of the internal doubler and internal foil.

NOTE : Before sticking the stabilene tracing paper, make provision for the raised heads of attachment fittings not removed

- (d) Stick two sheets of stabilene tracing paper in the inside of the barrel. Locate the positions of the holes on the tracing sheet and trace the outlines of the external doublers and foils.

(3) Preparation of doublers and foils.

- (a) From sheet metal Z8 CND 15 (P 3305) thickness 1,2 mm (0.047 in.), cut out :

78-13-01

REP 29-190-21

Page 402

OVERHAUL

- 1 The internal doubler, dimensions 495 mm (19.49 in.) x 215 mm (8.46 in.) approx.
 - 2 Forward external doubler, dimensions 215 mm (8.46 in.) x 155 mm (6.10 in.) approx.
 - 3 Rear external doubler, dimensions 250 mm (9.84 in.) x 190 mm (7.48 in.) approx.
- (b) From sheet metal 28 CND 15 (P 3305), thickness 0,3 mm (0.012 in.), cut out :
- 1 Internal foil, dimensions 186 mm (7.32 in.) x 185 mm (7.28 in.) approx.
 - 2 Forward external foil, dimensions 185 mm (7.28 in.) x 155 mm (6.10 in.) approx.
 - 3 Rear external foil, dimensions 212 mm (8.35 in.) x 160 mm (6.3 in.) approx.
- (c) Shape the doublers and foils according to the shape of the panel.
- (d) Stick the stabilene to the side of the internal doubler which will be in contact with the panel. Trace the outline of the doubler as indicated in figure 403. On the doubler, locate the positions of holes, dia. 18 mm (0.71 in.), allowing passage of fitting attachments not removed ; locate positions of the counterbores.
- (e) Stick the other stabilene tracing sheets to the side of the external doublers which will be in contact with the panel. Carry out the same procedure as for the internal doubler.
- (f) Shape the outlines of the doublers and radius the ends in contact with the panel, as specified in figure 402, sheets 3 and 4.
- (g) Drill the dia. 18 mm (0.71 in.) holes in the doublers, counterbore as indicated in figure 402, sheet 3 and deburr.
- (h) Stick the stabilene tracing sheets to the sides of the foils which will be in contact with the panel. Trace the outlines of the foils as indicated in figure 403.
- (i) Apply heat treatment to the doublers according to procedures M 822 and M 821 of chapter 70-45-10 of standard practices.

78-13-01

REP 29-190-21

Page 403

MK.610-14-28
OVERHAUL

- (k) Reshape doublers if necessary.
- (4) Drilling of doublers, figure 402).
- (a) Position the internal doubler on the panel.
Centre mark the positions of the four corner holes on the doubler (on forward frame and longitudinal angle bars).
- (b) Remove doubler and drill the four holes dia.
 $3 \pm 0,1 \text{ mm}$ ($0.114 - 0.122 \text{ in.}$) in it and deburr.
- (c) Offer the doubler up to the panel and check the alignment of the holes. If necessary, rework the doubler until alignment is correct.
- (d) Remove the internal doubler. Bore the two forward holes marked "L" and "N", dia. $5,05 + 0,08$ mm ($0.199 - 0.202 \text{ in.}$) ; and the two rear holes, dia. $4,83 + 0,1$ mm ($0.190 - 0.194 \text{ in.}$). Rebore the hole on the panel marked "N", dia. $5,05 \text{ mm}$ (0.199 in.).
- (e) Pin the doubler in position on the panel using the four holes. Centre mark the positions of all the other holes on the doubler.
- (f) Remove the doubler ; drill all the holes, dia. $3 \pm 0,1 \text{ mm}$ ($0.114 - 0.122 \text{ in.}$) and deburr.
- (g) Pin doubler in position on the panel and check the alignment of the holes. If necessary, rework the doubler until alignment is correct.
- (h) Remove the doubler and bore :
- 1 Holes marked "F", "G", "H", dia. $4,17 + 0,1$ mm ($0.164 - 0.168 \text{ in.}$).
- 2 Holes marked "D", "E", "J", dia. $4,83 + 0,1$ mm ($0.190 - 0.194 \text{ in.}$).
- 3 Hole marked "M", dia. $5,05 + 0,08$ mm ($0.199 - 0.202 \text{ in.}$).
- Deburr.

78-13-01

REP 29-190-21

Page 404

Jun 15/82

OLYMPUS 593

MK.610-14-28
OVERHAUL

- (j) Pin doubler in position on the panel. On the doubler and panel, counterdrill the holes marked "A" and "C", dia. $4,17 + 0,1 \text{ mm}$ ($0.164 - 0.168 \text{ in.}$).
- (k) Position the internal foil on the panel. Centre mark the positions of attachment holes on the foil.
- (l) Remove the foil and drill the holes marked "A" and "G", dia. $4,17 + 0,1 \text{ mm}$ ($0.164 - 0.168 \text{ in.}$) and deburr.
- (m) Position the external doublers on the panel. Centre mark the positions of attachment holes on the doublers.
- (n) Remove doublers. Drill all the holes dia. $3 \pm 0,1 \text{ mm}$ ($0.114 - 0.112 \text{ in.}$) and deburr.
- (o) Position the doublers and check alignment of holes. If necessary, rework until alignment is correct.
- (p) Remove and on the doublers, bore
- 1 Holes marked "A" - "C" - "G" - "H", dia. $4,17 + 0,1 \text{ mm}$ ($0.164 - 0.168 \text{ in.}$).
 - 2 Holes marked "D" - "E", dia. $4,83 + 0,1 \text{ mm}$ ($0.190 - 0.194 \text{ in.}$).
- (q) Position external foils on panel. Centre mark positions of attachment holes.
- (r) Remove foils and drill attachment holes, dia. $4,17 + 0,1 \text{ mm}$ ($0.160 - 0.164 \text{ in.}$) in them. Deburr.
- (s) On the panel, rebore the holes for passage of spacers, dia. $5,5 + 0,1 \text{ mm}$ ($0.216 - 0.220 \text{ in.}$).

NOTE : Do not pierce the inner skin of the panel.

OLYMPUS 593

MK.610-14-28
OVERHAUL

(5) Installation of doublers.

- (a) Fit spacers 002-003-992-1 in holes "A" and 002-003-992-3 in holes "C" with loctite 307 (P 502) in order to hold them in place during installation of attachment fittings.
 - (b) Pin the foils and doublers in position on the panel.
 - (c) Install the assembly as indicated in figure 402 and in the following standard practices :
 - 1 chapter 70-50-60 for attachment fittings "L"-
"M"- "N"
 - 2 chapter 70-50-40 for other attachment fittings.
- NOTE : In the rear part, those attachment fittings not bearing on the internal doubler are installed with a thrust washer as indicated figure 402, sheet 5/6
- (d) Check the installation of fitting attachments according to standard practices, chapters 70-50-84 and 70-50-86.

C. Repair of delaminations in zone 3. Figure 404.

(1) Removal of existing fitting attachment.

- (a) Remove fitting attachments from the panel as indicated by figure 404 and in the following chapters of standard practices :
 - 1 chapter 70-50-30 for attachment fittings "D"-
"E"- "N"
 - 2 chapter 70-50-40 for attachment fittings "G"-
"F"- "J"- "H"
 - 3 chapter 70-50-60 for attachment fittings "L"-
"M"

(2) Location of attachment holes for doublers.

- (a) Lightly rub the internal panel of the barrel with a very fine emery cloth until the cellular structure of the zone to be repair appears.

78-13-01

REP 29-190-21

Page 406

Jun 15/82

OLYMPUS 593

MK.610-14-28
OVERHAUL

- (b) Centre mark the positions of holes marked "A" and "C" (see figure 404). Drill these holes in the panel, dia. $3 \pm 0,1$ mm (0.114 - 0.122 in.) and deburr.

NOTE : It is essential that each hole be positioned in the centre of a cell.

- (c) Stick stabilene tracing paper to the internal face of the panel. Locate the positions of all attachment holes on the stabilene and trace the outline of internal doubler and foil.

NOTE : Before sticking stabilene sheet in a place, make provision for raised heads of remaining attachment fittings.

- (d) Stick two sheets of stabilene to the inside of the barrel. Indicate the locations of the holes and trace the outline of doublers and foils on the stabilene.

(3) Preparation of doublers and foils.

- (a) From sheet metal Z8 CND 15 (P 3305), thickness 1,2 mm (0.047 in.), cut out :

- 1 Internal doubler, dimensions 495 mm (19.49 in.) x 218 mm (8.58 in.) approx.
- 2 Forward external doubler, dimensions 218 mm (8.58 in.) x 155 mm (6.10 in.) approx.
- 3 Rear external doubler, dimensions 250 mm (9.48 in.) x 195 mm (7.67 in.) approx.

- (b) From sheet metal Z8 CND 15 (P 3305), thickness 1,2 mm (0.047 in.), cut out :

- 1 Internal foil, dimensions 186 mm (7.32 in.) x 190 mm (7.48 in.) approx.
- 2 Forward external foil, dimensions 190 mm (7.48 in.) x 155 mm (6.10 in.) approx.
- 3 Rear external foil, dimensions 212 mm (8.35 in.) x 165 mm (6.49 in.) approx.

- (c) Shape the doublers and foils according to the shape of the panels.

- (d) Stick the stabilene sheet to the side of the internal doubler which will be in contact with the

78-13-01

OVERHAUL

panel. Trace the outline of the doubler. On the stabilene sheet, indicate the positions of the holes, dia. 18 mm (0.71 in.), for the passage of fitting attachments not removed, and the positions of the counterbores.

- (e) Stick the other stabilene sheets to the sides of the external doublers which will be in contact with the panels. Perform the same operations for the internal doubler.
 - (f) Machine the outlines of the doublers and radius the ends in contact with the panel as specified in figure 402, sheets 3 and 4.
 - (g) Drill the dia. 18 mm (0.71 in.) holes in the doublers and deburr. Machine the counterbores as specified in figure 402, sheet 3.
 - (h) Stick the stabilene sheets to the side of the foil which will be in contact with the panel. Trace out and then machine the outlines of the foils.
 - (j) Apply heat treatment to doublers according to procedures M 822 and M 821 of chapter 70-45-10 of standard practices.
 - (k) Reshape doublers if necessary.
- (4) Drilling of doublers (figure 402).
- (a) Position internal doubler on panel. Centre mark the positions of four corner holes on the doubler (on forward frame and longitudinal angle bars).
 - (b) Remove the doubler. Drill the four dia. $3 \pm 0,1$ mm (0.114 - 0.122 in.) holes in the doubler and deburr.
 - (c) Offer up the doubler to the panel, check alignment of holes. If necessary, rework the doubler until alignment is correct.
 - (d) Remove internal doubler. Drill the two forward holes marked "L" and "N", dia. $5,05 \begin{smallmatrix} + 0,08 \\ + 0 \end{smallmatrix}$ mm (0.199 - 0.202 in.) and the two rear holes, dia. $4,83 \begin{smallmatrix} + 0,1 \\ + 0 \end{smallmatrix}$ mm (0.190 - 0.194 in.).

OVERHAUL

- (e) Pin the doubler in position on the panel through the four holes ; centre mark all of the other holes on the doubler.
- (f) Remove the doubler, and drill all dia. $3 \pm 0,1$ mm (0.114 - 0.122 in.) holes. Deburr.
- (g) Pin the doubler in position on the panel, and check the alignment of holes. If necessary, re-adjust until alignment is correct.
- (h) Remove doubler. Drill :
- 1 Holes marked "F", "G" and "H", dia. $4,17 + 0,1$ mm (0.164 - 0.168 in.).
 $+ 0$
 - 2 Holes marked "D", "E" and "J", dia. $4,83 + 0,1$ mm (0.190 - 0.194 in.).
 $+ 0$
 - 3 Holes marked "L", dia. $5,05 + 0,08$ mm (0.199 - 0.202 in.).
 $+ 0$
- Deburr.
- (j) Pin doubler to panel. On doubler and panel, counterdrill holes marked "A" and "C", dia. $4,17 + 0,1$ mm (0.164 - 0.168 in.).
 $+ 0$
- (k) Position the internal foil on the panel. Centre mark the positions of the attachment holes on the foil.
- (l) Remove the foil. On the foil, drill the following holes in the positions indicated by figure 404 :
holes "A" and "G", dia. $4,17 + 0,1$ mm (0.164 - 0.168 in.) ; holes "J", dia. $4,83 + 0,1$ mm (0.190 - 0.194 in.) and deburr.
 $+ 0$
- (m) Position external doublers on the panel. Centre mark the positions of attachment holes on the doublers.
- (n) Remove doublers. Drill all dia. $3 \pm 0,1$ mm (0.114 - 0.122 in.) holes and deburr.

(o) Position doublers, check alignment of holes. If necessary, re-adjust until alignment is correct.

(p) Remove. Drill the following holes in the doublers :

1 Holes marked "A"-"C"-"G"-"H", dia.

4,17 $\begin{smallmatrix} + 0,1 \\ + 0 \end{smallmatrix}$ mm (0.164 - 0.168 in.).

2 Holes marked "D"-"E"-"J", dia. 4,83 $\begin{smallmatrix} + 0,1 \\ + 0 \end{smallmatrix}$ mm
(0.190 - 0.194 in.).

Deburr.

(q) Position external foils on the panel. Centre mark attachment holes.

(r) Remove foils. Drill attachment holes dia.

4,17 $\begin{smallmatrix} + 0,1 \\ + 0 \end{smallmatrix}$ mm (0.164 - 0.168 in.) in the foils
and deburr.

(s) Rebore the holes for the spacers, dia.

5,5 $\begin{smallmatrix} + 0,1 \\ + 0 \end{smallmatrix}$ mm (0.216 - 0.220 in.) on the panels.

NOTE : Do not pierce the inner skin of the panel.

(5) Installation of doublers.

(a) Fit spacers 002-003-991-1 in holes "A" and spacers 002-003-992-3 in holes "C" with loctite 307 (P 502) to hold them in place during installation of attachment fittings.

(b) Pin the foils and doublers in position on the panel.

(c) Attach assembly according to figure 402 and the following standard practices :

1 chapter 70-50-60 for attachment fittings "L"-"M"-"N",

2 chapter 70-50-40 for other attachment fittings.

NOTE : In the rear part, attachment fittings not bearing on the internal doubler are installed with a thrust washer as indicated in figure 402, sheet 5/6.

(3) Preparation of doublers and foils.

- (a) From sheet metal Z8 CND 15 (P 3305), thickness 1,2 mm (0.047 in.), cut out :
 - 1 Forward external doubler, dimensions 215 mm (8.46 in.) x 185 mm (7.28 in.) approx.
 - 2 Rear external doubler, dimensions 225 mm (8.86 in.) x 188 mm (7.40 in.) approx.
 - 3 Forward internal doubler, dimensions 215 mm (8.56 in.) x 180 mm (7.08 in.) approx.
 - 4 Rear internal doubler, dimensions 280 mm (11.02 in.) x 215 mm (8.46 in.).
- (b) From sheet metal Z8 CND 15 (P 3305), thickness 0,3 mm (0.012 in.), cut out the rear external foil, dimensions 165 mm (6.50 in.) x 160 mm (6.3 in.) approx.
- (c) Shape the doublers and foils according to the shape of the panel.
- (d) Stick the stabilene sheets onto the side of the internal doublers which will be in contact with the panel. Trace the outline of the doublers. On the doublers, locate the positions of the holes, dia. 18 mm (0.71 in.) for the passage of fitting attachments not removed. Indicate the positions of the counterbores.
- (e) Stick the other stabilene tracing sheets to the side of the external doublers which will be in contact with the panel. Perform the same operation for the internal doublers.
- (f) Machine the outlines of the doublers and radius the ends in contact with the panel according to figure 402, sheets 3 and 4.
- (g) Drill the holes, dia. 18 mm (0.71 in.) in the doublers. Machine counterbores according to figure 402, sheet 3. Deburr.
- (h) Stick stabilene tracing sheets to the side of the foils which will be in contact with the panel. Trace the outline of the foils and then machine.
- (j) Apply heat treatment to doublers according to procedures M 822 and M 821 of chapter 70-45-10 of standard practices.

OVERHAUL

- (k) Reshape doublers if necessary.
- (4) Drilling of doublers (figure 402).
- (a) Position internal doublers on the panel. Centre mark attachment holes on the doublers.
- (b) Remove doublers. Drill the holes, dia. $3 \pm 0,1$ mm (0.114 - 0.122 in.) and deburr.
- (c) Offer the doublers up to the panel and check the alignment of holes. If necessary, rework doublers until alignment is correct.
- (d) Remove doublers. Drill as follows :
- 1 Holes "D" and "J", dia. $4,83 + 0,1$ mm (0.190 - 0.194 in.).
- 2 Holes "L", "M", "N", dia. $5,05 + 0,08$ mm (0.199 - 0.202 in.).
- Rebore hole "N" on panel, to dia. 5,05 mm (0.199 in.).
- (e) Pin doublers on the panel. Counterdrill holes marked "A" and "C", dia. $4,17 + 0,1$ mm (0.164 - 0.168 in.) in doublers and panel. Deburr.
- (f) Position external doublers on the panel. Centre mark positions of attachment holes on these doublers.
- (g) Remove the doublers. Drill holes dia. $3 \pm 0,1$ mm (0.114 - 0.122 in.). Deburr.
- (h) Position the doublers and check alignment of holes. If necessary, re-adjust until alignment is correct.
- (j) Remove doublers and drill the following :
- 1 Holes "A"- "C"- "G"- "H", dia. $4,17 + 0,1$ mm (0.164 - 0.168 in.).

OLYMPUS 593

MK.610-14-28
OVERHAUL

2 Holes "D"-"E"-"J", dia. $4,83 \begin{smallmatrix} + 0,1 \\ + 0 \end{smallmatrix}$ mm (0.190 - 0.194 in.).

Deburr.

(k) Position external foil on panel. Centre mark positions of attachment holes.

(l) Remove foil and drill holes dia. $4,17 \begin{smallmatrix} + 0,1 \\ + 0 \end{smallmatrix}$ mm (0.164 - 0.168 in.). Deburr.

(m) On the panel, rebore the holes for the spacers, dia. $5,5 \begin{smallmatrix} + 0,1 \\ + 0 \end{smallmatrix}$ mm (0.216 - 0.220 in.).

NOTE : Do not pierce the internal skin of the panel.

(5) Installation of doublers.

(a) Install spacers 002-003-992-1 in holes "A" and spacers 002-002-992-3 in holes "C", with loctite 307 (P 502) to hold fitting attachments in place.

(b) Pin the foils and doublers in position on the panel.

(c) Attach the assembly according to the procedure specified in figure 402 and the following standard practices :

1 chapter 70-50-60 for fitting attachments "L"-"M"-"N",

2 chapter 70-50-40 for other fitting attachments

NOTE : On the rear part, fitting attachments not bearing directly on the internal doubler are fitted with a thrust washer as indicated in figure 402 sheet 5/6.

(d) Check the installation of fitting attachments according to procedure given in chapters 70-50-84 and 70-50-86 of standard practices.

OVERHAUL

E. Repair of delamination in zone 2. Figure 408.

(1) Removal of existing fitting attachments.

- (a) Remove fitting attachments from panel according to procedure specified in figure 408 and in the following chapters of standard practices :

- 1 chapter 70-50-40 for fitting attachments marked "F" and "G"
- 2 chapter 70-50-60 for fitting attachments marked "L"

(2) Location of the position of attachment holes for doublers.

- (a) Lightly rub the internal panel of the barrel with a very fine emery cloth until the cellular structure of the zone to be repaired is visible.
- (b) Centre mark the positions of holes "A" and "B" on the panel (see figure 408). Drill these holes in the panel, dia. $3 \pm 0,1$ mm (0.114 - 0.122 in.) and deburr.

NOTE : It is essential that each hole be located in the middle of a cell.

- (c) Stick two sheets of stabilene tracing paper to the inside of the bucket. On these stabilene sheets, locate the positions of the holes and trace the outlines of external doublers and foils.

(3) Preparation of doublers and foils.

- (a) From sheet metal Z8 CND 15 (P 3305), thickness 1,2 mm (0.047 in.), cut out :
- 1 the internal doubler, dimensions 420 mm (16.53 in.) x 275 mm (10.82 in.) approx. These dimensions are greater than those of the finished doubler.
 - 2 The forward external doubler, dimensions 265 mm (10.43 in.) x 150 mm (5.90 in.) approx.
 - 3 The rear external doubler, dimensions 210 mm (8.26 in.) x 170 mm (6.69 in.) approx.

- (b) From sheet metal Z8 CND 15 (P 3305), thickness 0,3 mm (0.012 in.), cut out :
 - 1 The forward internal foil, dimensions 265 mm (10.43 in.) x 145 mm (5.71 in.) approx.
 - 2 The rear external foil, dimensions 135 mm (5.31 in.) x 90 mm (3.53 in.).
- (c) Shape the doublers and foils according to the outline of the panel.
- (d) Centre mark and drill openings, dia. 18 mm (0.71 in.) in internal doubler (see figure 408) and counterbores in compliance with figure 403 (sheet 3).
- (e) Stick the stabilene sheets to the sides of the external doublers which will be in contact with the panel. Perform the same operations as for internal doubler.
- (f) Machine the outline of the doublers and radius the ends in contact with the panel as specified in figure 402 sheet 4/6.
- (g) Stick the stabilene sheets to the sides of the foils which will be in contact with the panel. Trace out and then machine the outlines of the foils.
- (h) Apply a heat treatment to the doublers according to procedures M 822 and M 821 of chapter 70-45-10 of standard practices.
- (j) Reshape doublers if necessary.
- (4) Drilling of the doublers (figure 408).
 - (a) Position the internal doubler on the panel. Centre mark the positions of holes "F"-"G"-"L" on the doubler.
 - (b) Remove the doubler. Drill the marked holes, dia. $3 \pm 0,1$ mm (0.114 - 0.122 in.) and deburr.

F. Repair of delamination in zone 5 - Figure 410.

(1) Removal of existing fittings.

- (a) Remove fitting attachments from the panel according to figure 410 and to the procedures specified in the following chapters of standard practices :

- 1 chapter 70-50-40 for fitting attachments marked "F"-"G"-"K"
- 2 chapter 70-50-60 for fitting attachments marked "L"

(2) Location of attachment holes for doublers.

- (a) Lightly rub the panel inside the barrel with very fine emery cloth until the cellular structure of the zone to be repaired is visible.
- (b) Centre mark the positions of holes "A"-"B"-"C" (see figure 402). Drill these holes, dia. $3 \pm 0,1$ mm (0.114 - 0.122 in.) in the panel and deburr.

NOTE : It is essential that each hole be located in the centre of a cell.

- (c) Stick stabilene tracing paper to the inside face of the panel. On the stabilene, locate the positions of all attachment holes and trace the outlines of the internal doubler and foil.

NOTE : Before sticking the stabilene, make provision for the raised heads of fitting attachments not removed.

- (d) Stick two sheets of stabilene to the inside of the barrel. On the stabilene locate the positions of the holes and trace the outlines of external doublers and foils.

OLYMPUS 593

MK.610-14-28
OVERHAUL

(3) Preparation of doublers and foils.

(a) From sheet metal Z8 CND 15 (P 3305), thickness 1,2 mm (0.047 in.), cut out :

- 1 the internal doubler, dimensions 420 mm (16.53 in.) x 275 mm (10.82 in.) approx. These dimensions are larger than the dimensions of the finished doubler.
- 2 the forward external doubler, dimensions 265 mm (10.43 in.) x 150 mm (5.90 in.) approx.
- 3 the rear external doubler, dimensions 210 mm (8.27 in.) x 170 mm (6.69 in.) approx.

(b) From sheet metal Z8 CND 15 (P 3305), thickness 0,3 mm (0.012 in.), cut out :

- 1 the forward internal foil, dimensions 265 mm (10.43 in.) x 150 mm (5.90 in.) approx.
- 2 the rear external foil, dimensions 135 mm (5.31 in.) x 90 mm (3.54 in.) approx.

(c) Shape the doublers and foils according to the outline of the panel.

(d) Centre mark and drill holes in the internal doubler, dia. 18 mm (0.71 in.), see figure 410. Machine the counterbores as indicated in figure 402 sheet 3.

(e) Stick the stabilene sheets to the sides of the external doublers which will be in contact with the panel. Perform the same operations as for the internal doubler.

(f) Machine the outlines of the doublers and radius the ends in contact with the panel as indicated in figure 402, sheet 4/6.

(g) Stick the stabilene sheets to the side of the foils which will be in contact with the panels. Trace the outlines of the foils and then machine.

(h) Apply a heat treatment to the doublers according to procedures M 822 and M821 of chapter 70-45-10 of standard practices.

(4) Drilling of doublers.

- (a) Stick the stabilene sheet for the forward part to the side of the internal doubler which will be in contact with the panel.
- (b) Centre mark the positions of the holes marked "A" on the doubler.
- (c) Drill the holes "A" on the doubler, dia. $2,5 \pm 0,1$ mm (0.094 - 0.102 in.) and deburr.
- (d) Position the internal doubler on the panel and pin it by means of the previously drilled holes. If necessary, rework until alignment is correct.
- (e) Remove the doubler. Bore holes, dia. $3 \pm 0,1$ mm (0.114 - 0.122 in.).
- (f) Pin the internal doubler to the panel. On the internal doubler locate the positions of all the attachment holes.
- (g) Remove the doubler. Drill all the holes dia. $3 \pm 0,1$ mm (0.114 - 0.122 in.) and deburr.
- (h) Pin the internal doubler to the panel. Check the alignment of the holes. If necessary, rework until alignment is correct.
- (j) Remove the doubler. Bore :
 - 1 Holes marked "A"- "B"- "C" and "G", dia. $4,17 \begin{smallmatrix} + 0,1 \\ + 0 \end{smallmatrix}$ mm (0.164 - 0.168 in.).
 - 2 Holes marked "D", dia. $4,83 \begin{smallmatrix} + 0,1 \\ + 0 \end{smallmatrix}$ mm (0.190 - 0.194 in.).
 - 3 Holes marked "L", dia. $5,05 \begin{smallmatrix} + 0,5 \\ + 0 \end{smallmatrix}$ mm (0.199 - 0.202 in.).Deburr.
- (k) Machine the internal doubler according to figure 402 (sheets 3 and 4), 410 and 411 (sheet 3).

OLYMPUS 593

MK.610-14-28
OVERHAUL

(l) Stick the stabilene sheets to the sides of the external doublers which will be in contact with the panel. Centre mark the positions of these attachment holes on the doublers.

(m) Drill the holes in the external doublers, dia. $3 \pm 0,1$ mm (0.114 - 0.122 in.) and deburr.

(n) Position the external doublers on the panel. Check alignment of holes. If necessary, rework until alignment is correct.

(o) On the external doubler, bore :

1 Holes marked "A"- "B" and "C", dia. $4,17 \begin{smallmatrix} + 0,1 \\ + 0 \end{smallmatrix}$ mm (0.164 - 0.168 in.).

2 Hole marked "K", dia. $4,83 \begin{smallmatrix} + 0,1 \\ + 0 \end{smallmatrix}$ mm (0.190 - 0.194 in.).

Deburr.

(p) Stick the stabilene sheets to the sides of the foils which will be in contact with the panel. Centre mark the positions of attachment holes on the foils.

(q) On the foil, drill :

1 Holes marked "A"- "B" and "C", dia. $4,17 \begin{smallmatrix} + 0,1 \\ + 0 \end{smallmatrix}$ mm (0.164 - 0.168 in.).

2 Hole marked "K", dia. $4,83 \begin{smallmatrix} + 0,1 \\ + 0 \end{smallmatrix}$ mm (0.190 - 0.194 in.).

Deburr.

(r) On the panel, drill the holes marked "A"- "B"- "C", dia. $4,17 \begin{smallmatrix} + 0,1 \\ + 0 \end{smallmatrix}$ mm (0.164 - 0.168 in.).
Deburr.

(s) On the panel, bore the holes for the spacers, dia. $5,5 \begin{smallmatrix} + 0,1 \\ + 0 \end{smallmatrix}$ mm (0.216 - 0.220 in.).

MK.610-14-28
OVERHAUL

A. Introduction.

- (1) In this repair procedure, two cases of nut replacement may occur:
 - (a) Replacement of accessible nuts, according to instructions of paragraph B.
 - (b) Replacement of nuts riveted on support plates, according to paragraph C.

B. Replacement of accessible nuts.

- (1) Remove the damaged nuts according to figure 401, after having removed the attachment parts according to:

- (a) Chapter 70-50-10 of the Standard Practices and plate 9 (section NN) for the solid rivets.

NOTE: Recover the shims BAS9373C4WJ and/or 302-042-500-0 from under the nuts.

- (b) Chapter 70-50-50 of the Standard Practices and plates 7 (view F2) and 10 (section P) for the blind rivets.

- (2) Install and secure a new rivet as follows:

- (a) Plate 9 (section N) and chapter 70-50-10 of the Standard Practices for the solid rivets or chapter 70-50-50 of the Standard Practices for the blind rivets.

NOTE: Do not forget to position the shims under the nuts removed in paragraph B (1).

- (b) Plate 7 (view F2) and/or plate 10 (section P) and chapter 70-50-50 of the Standard Practices for the blind rivets.

- (3) Check the riveting of the attachment parts of the nuts on the nozzle according to:

- (a) Chapter 70-50-81 of the Standard Practices for the solid rivets.
 - (b) Chapter 70-50-85 of the Standard Practices for the blind rivets.

OVERHAUL

C. Replacement of the nuts riveted on the support plates.

(1) Remove the access blanking panels:

- (a) To plates 1 and/or 4 and/or 5 and/or 6 and/or 9, according to figure 401 plates 2 and 3 and DISASSEMBLY section paragraph 28 or this overhaul manual.
- (b) To plates 2 and/or 3 and/or 7 and/or 8 by removing the blind rivets according to chapter 70-50-50 of the Standard Practices and figure 401 plate 3 view F1.

(2) Remove the support plates of the nuts according to figure 401 and as follows:

- (a) Use a copper wire, or equivalent, to secure the support plates to prevent them from falling to the bottom of the sealed chambers, during the removal of the attachment parts.
- (b) Remove the attachment parts of the plates on the structure, according to:

1 Chapter 70-50-50 of the Standard Practices for plates 2, 3, 7, 8, 10 and 11.

2 Chapter 70-50-60 of the Standard Practices for plates 1, 4, 5, 6 and 9.

3 Recover the shims and/or the washers after having marked their position on the structure.

- (c) Remove the support plates by the passage holes. Mark their position on the structure.

(3) Replace the damaged nuts on the support plates, according to figure 402 and as follows:

- (a) Remove the damaged nut by removing the solid rivets according to chapter 70-50-10 of the Standard Practices.
- (b) Position a new nut on the plate, then install new solid rivets according to chapter 70-50-10 of the Standard Practices.

OVERHAUL

- (c) Check the riveting of the nuts on the support plate according to chapter 70-50-81 of the Standard Practices.
- (4) Install the support plates on the structure according to figure 401 and as follows:
 - (a) If blind rivets are selected for installation in section J of plate 5, rebores the components to be installed to 5,21-5,31 mm diameter (0.205-0.209 in Dia).
 - (b) Using a copper wire or equivalent, in function of the positions marked in paragraph 2.C, position then fasten the support plate(s), the milled washers and/or the riveting plate.
 - (c) Install the attachment part according to:
 - 1 Chapter 70-50-50 of Standard Practices for the blind rivets.
 - 2 Chapter 70-50-60 of Standard Practices for blind bolts.

NOTE: Do not forget the plain washers under the hexagon heads of the bolts.

 - (d) Check the riveting of the support plates on the structure, according to:
 - 1 Chapter 70-50-85 of the Standard Practices for the blind rivets.
 - 2 Chapter 70-50-86 of the Standard Practices for the blind bolts.
- (5) Remove all shavings and debris from inside the sealed chamber by suction, through the plates passage holes.
- (6) Blank the plates passage holes according to figure 401 plates 2 and 3.
 - (a) Install the borescope access door(s) according to ASSEMBLY section paragraph 30 of this overhaul manual.

REPAIR

TWIN SECONDARY NOZZLE (29-190, 191)

25. Replacement of the bushes in the fitting at the attachment point "R"

PARTS REQUIRED FOR REPAIR

Round Bar Z6NCT25 or A286 (P3601) Diameter 45 mm
(1.78 in.)

- A. Remove the bushes per figure 401 and the following procedure:
- (1) Make the extraction tool per figures 402 and 403.
 - (2) Install the nut in the bushes to be removed.
 - (3) Install the bell and the bolt.
 - (4) Remove the bushes by turning the screw while holding the nut.
- B. Clean the locating diameters for the bushes in the fitting using a clean cloth moistened with P325 (Acetone) or P422 (Methylethylketone) solvent.
- C. Re-bore the bushes recess with a 32 mm diameter (1.25 in.) reamer, able of 300 mm long (11.8 in.) boring, installed on a hand held pneumatic grinder, per figure 404, and the following procedure:
- (1) Re-bore the first locating diameter, using the second one as a guide.
 - (2) Continue the rework, in the second locating diameter, using the first re-bored diameter as a guide.
 - (3) Brake sharp angle per figure 404.

D. Perform a water washable dye penetrant check per standard practice M503A of chapter 70-20-10.

No cracks allowed.

E. Measure and record the exact bushes recess diameters in the fitting.

F. Machine the repair bushes out of round bar P3601 (A286 or Z6NCT25) per figure 405 and the following procedure:

(1) Rework the bush outer diameter to obtain an assembly fit of 0 to 0,046 mm (0.0018 in.) with the reworked fitting diameter.

(2) Mark the position of the bushes on the fitting per standard practice M21 of chapter 70-10-10.

G. Clean the locating diameters for the bushes in the fitting, and the bushes using a clean cloth moistened with P325 (Acetone) or P422 (Methylethylketone).

H. Install the bushes in the fitting per figure 406 and the following procedure:

(1) Chill the bush in liquid nitrogen.

(2) Position and install the bush in its recess using the nut (figure 402).

(3) Make sure the flange of the bush is in firm contact with the fitting.

(4) Perform the same procedure for the second bush.

I. Check the correct alignment of the bushes inner diameter per figure 406 by free installation of a 28,555-28,568 mm diameter rod (1.1242-1.1247 in.) or of the screw E51-1270.

J. If necessary, re-bore the inner diameter of the bushes to 28,6 mm maxi (1.126 in.).

K. Mark "REP 25" after the nozzle identification number per standard practice M21 of chapter 70-10-10.

Crimping Ring	SPC 9102C8CB-GF	(649-772-248-0)

A. Record of Position. (See figure 401).

- (1) Install the tool on the access door to be replaced.
Position in attachment inserts to be matchmarked
using following pins:
 - (a) 7 mm (0.276 in.) dia. for the lateral upper
access doors.
 - (b) 6,6 mm (0.260 in.) dia. for the central and the
lateral lower access doors.
- (2) Tighten the tool with the knurled screws.
- (3) Install the arms on each sides of the tool.
Position the arms in the "actual" inserts of the new
access door using the 7 mm (0.276 in.) or 6,6 mm
(0.260 in.) dia. pins. Tighten the arms.

78-13-01

REP 29-190-26

Page 401

OVERHAUL

sneema

- (4) Remove the tool from the access door to be replaced taking care not to move the arms.
- (5) Install the tool on the new access door. Position it on the inserts at the arms position using the 7 mm (0.276 in.) or 6,6 mm (0.260 in.) dia. pins.
- (6) Tighten the tool with the knurled screws.

B. Drilling of the Insert Holes. (See figure 402).

- (1) Install the new access door, fitted with the tool, on a vice.
- (2) Screw the drill guides in the tool for:
 - (a) 13 to 13,05 mm (0.512 - 0.514 in.) dia. holes for the lateral upper access doors.
 - (b) 11,05 to 11,10 mm (0.435 - 0.427 in.) dia. holes for the central and the lateral lower access doors.
- (3) Install a step drill fitted in a hand held drilling machine. Drill insert holes as described in chapter 70-30-10 and as follows:
 - (a) Drill from one side of the door until the pilot diameter of the step drill passes through the door.
 - (b) Ream the pilot hole from the other side of the door.
- (4) Remove the access door and the tool.
- (5) Draw-file the holes to break the sharp angles. Blow clean with shop air.

C. Recessing. (See figure 402).

- (1) Install the tool fitted with a drill guide on the new access door. Position in the hole drilled in step B.
- (2) Remove the drill guide and replace by the dies. Screw the dies until they come in contact with the door.

78-13-01

REP 29-190-26

Page 402

Jun 30/97

MK.610-14-28

OVERHAUL

SNECMA

- (3) Stamp recesses in the door by alternatively screwing the dies by a quarter of a turn each time, until the contact between the two dies is established.
- (4) Unscrew the dies and remove the tool.
- (5) Visually check recesses for cracks. No cracks allowed.

D. Crimping of Inserts. (See figure 403).

NOTE: This step can be performed after drilling of the other insert holes.

- (1) Install the tool on the access door and position using the insert hole.
- (2) Install the inserts in their holes as follows:
 - (a) Insert PN 302-063-600-0 with crimping ring PN 302-063-900-0 for the lateral upper access doors.
 - (b) Insert PN SPC 9102C8CB-SFC274 with crimping ring PN SPC 9102C8CB-GF for the central and the lateral lower access doors.
- (3) Screw the die, into the tool. Lightly tighten the inserts to bring them in contact with the door.
- (4) Screw the punch into the tool. Crimp the part by tightening the punch until it comes in contact with the die.
- (5) Remove the tool.

E. Inspection.

- (1) Check the crimping and inserts fitting per Figure 404.

F. Marking. (See figure 401).

- (1) Mark "REP 26" and serial number of the corresponding nozzle per method 28 of chapter 70-10-10 after the part number of the access door.

ASSEMBLY

1. General

- A. During assembly, follow the recommendations given in chapter 70-65-00 of the Manual of Standard Practices, and in the working procedures section of the Overhaul Manual.
- B. Use only tools and other special equipment nominated in the assembly procedures, and identified by a number SC... The tools are shown in the Illustrated Tools and Equipment Manual (I.T.E.M).
- C. During assembly of bolts and nuts, refer to pages 601-700 of the "Fits and Clearances" Chapter for :
 - (1) The tightening torque for the nut or bolt.
 - (2) The lubrication to be applied to the nut or bolt before assembly.

NOTE : Wire-locking of nuts or bolts is to be carried out using NC 15 Fe wire 0,8 mm (0.032 in) diameter, except for the electrical harnesses, where 0,6 mm (0.024 in) wire is to be used.

- D. The clearances to be checked during assembly are identified by a number. Refer to pages 601-700 of the "Fits and Clearances" chapter for the values to be respected.
- E. In the working procedures section of the Manual, parts are referenced to the I.P.L by two numbers in brackets, the first of which is the figure number in the I.P.L on which the part is shown, the second being the item number within that figure.

2. Location

The twin secondary nozzle is a monobloc assembly common to two engines (1-2 and 3-4) which, in addition to its function of ducting exhaust gas, ensures continuity of lines of the engine nacelle.

The two twin secondary nozzles fitted to the aircraft are not identical due to the geometrical evolution of the nacelles between two adjacent engines and the aircraft axis of symmetry.

The assembly operations detailed in this chapter pertain to the L.H. twin secondary nozzle (bays 1 and 2). When a difference exists for assembly of the R.H. twin secondary nozzle, this difference appears in the text.

3. Fitting of Front Framework Attachment Links

NOTE : The twin secondary nozzle assembly is fixed to the transport trolley - tool SC 36 -

A. Equipment of the Brackets on the Side Walls

Carry out the following operations for each bracket :

- (1) Fit the bearing housing (29-110) in each bracket. secure each bearing housing with a locking ring (29-90).
- (2) Tighten the locking ring to the recommended torque and lock it using split pin (29-80).
- (3) Fit a spherical bearing (29-100) to each bearing housing, and retain it with locking ring (29-70).
- (4) Tighten the locking ring to the recommended torque and lock it with the split pin (29-60).

NOTE : The head of the split pin is inside the ring.

- (5) Fit spherical bearing bushes (29-50) and pin (29-40).

B. Fitting of the Attachment Links on the Central Wall

- (1) Fit the bearing housing (29-180) in the bracket. Fix the bearing housing using locking ring (29-160).
- (2) Tighten the locking ring to the recommended torque and lock it using split pin (29-150).
- (3) Fit bearing (29-170) into the bearing housing and retain it using locking ring (29-140).
- (4) Tighten the locking ring to the recommended torque and lock it using split pin (29-130).

NOTE : The head of the pin is inside the ring.

- (5) Fit the spherical bearing bushings (29-120).

OLYMPUS 593

MK.610-14-28

OVERHAUL

4. Installation of the Twin Secondary Nozzle on the Assembly/
Disassembly Workstand

- A. Installation of the Upper Handling Attachment Point -
tool SC 194
- (1) Rotate the handling equipment attachment point on the crossbeam, at the level of the access doors to the bucket pneumatic actuators.
 - (2) Secure the fitting with two bolts, tighten the bolts.
- B. Position the Twin Secondary Nozzle Assembly on the Rotating Stand - tool SC 117
- (1) Position the hoisting beam - tool SC 195 - above the secondary nozzle and secure it to the three hoisting points.
 - (2) Take up the slack in the slings and adjust the hoisting beam centre of gravity to balance the load.
 - (3) Free the secondary nozzle from the transport trolley and raise it.
 - (4) Position the nozzle on the rotating stand (in the horizontal position) and secure it using the three pins.
Secure the pins with the locking pins provided for this purpose.

NOTE : Do not forget to install the protection rings.

- (5) Remove the hoisting beam - tool SC 195.

5. Installation of Electrical Wiring Harnesses

CAUTION

PRIOR TO THE FINAL TIGHTENING OF THE ATTACHMENT BOLTS, ENSURE A 5 MM (0.1968 IN) CLEARANCE WITH RESPECT TO THE STRUCTURE SHARP EDGES, BOLT HEADS, RIVET HEADS, NUTS.

- A. Operate the Rotating Stand - tool SC 117 - to Bring the Secondary Nozzle into the Vertical Position.
- B. Installation of the Bay 1 Electrical Wiring Harness (27-60)
(figure 502)
- (1) Position the support assembly (27-210) and secure it using bolt (27-200) and nut (27-190).

Page 505
May 31/76

OLYMPUS 593

MK.610-14-28
OVERHAUL

- (2) Introduce the sheathed harness (thermo-shrinking sheath) in the guide-tube up to the location of the bucket position transmitter (indicator).
 - (3) Fix the wiring box using bolts (27-160).
 - (4) Position clip D and secure it using bolt (27-110) and self-locking nut (27-100).
 - (5) Secure clip C using bolt (27-90) and the locking plate.
 - (6) Position the teflon spiral (27-220) on the cable and secure it using clips E and J.
 - (7) Secure the clips :
 - (a) clip E using self-locking nut (27-100) and bolt (27-110)
 - (B) clip J using bolt (27-170).
 - (8) Locate the teflon sheathed wiring harness in the channel unit and secure it using three clips, F, G and H, around the gutter by bolts (27-130) and self-locking nuts (27-120).
 - (9) Position the wiring harness leading to the bucket drive pneumatic actuator and secure the junction box using bolts (27-150) and self-locking nuts (27-140).
 - (10) Secure clips A and B, which retain the wiring harness in the channel, using bolts (27-80) and self-locking nuts (27-70).
 - (11) Tighten the bolts and nuts to the recommended torques.
- C. Installation of the Bay 2 Electrical Wiring Harness (26-10) (figure 503)
- (1) Introduce the sheathed wiring harness (thermo-shrinking sheath) into the guide-tube up to the location of the bucket position transmitter (indicator).
 - (2) Secure the harness distribution box using bolts (26-200) and (26-210).
 - (3) Secure clip K using bolt (26-150) and self-locking nuts (26-140).

OVERHAUL

- (4) Check that the wiring harness is correctly positioned and secure clip J using the locking plate and bolt (26-130).
 - (5) Locate the teflon spiral (26-250) to the wiring harness, and secure it in position using clip (26-240) and clip L.
 - (6) Secure clip L using bolt (26-150) and self-locking nut (26-140).
 - (7) Position the wiring harness in the gutter and secure clips M, N and P using bolts (26-170) and self-locking nuts (26-160).
 - (8) Secure the two connectors, located at the front of the box, in the supports, and secure them using bolts (26-190) and self-locking nuts (26-180).
 - (9) Attach the largest sheath to the gutter, using clip B secured by bolt (26-50) and self-locking nut (26-40).
 - (10) Simultaneously secure the large sheath and the upper smaller sheath which leads to the bucket drive pneumatic actuator, using clips A secured by bolts (26-30), self-locking nuts (26-20) and the locking plate.
 - (11) Secure the large sheath to the structure using three clips C, E and F secured by bolts (26-70) and self-locking nuts (26-60) and the locking plates.
 - (12) Secure the large sheath to the structure using clip D, secured by bolt (26-80) and a locking plate.
 - (13) Secure the larger sheath using clips G and H and bolts (26-100) and nuts (26-90).
 - (14) Tighten the mounting elements to the recommended torques.
 - (15) Attach the end with the connectors to the structure using adhesive tape, pending installation of a cross-feed isolation valve.
- D. Installation of the Bay 1 Primary Nozzle Area Transducer Harness
- (1) Remove the blanking cap (30-30) from the fixed connector of harness (28-10).

PRINTED IN FRANCE

OLYMPUS 593

MK.610-14-28

OVERHAUL

- (2) Position square plate (28-300) to the fixed connector using cylindrical head screws (28-20) and square spaces (28-30). Wire lock screws (28-30) in pairs and refit the blanking cap.
- (3) Introduce the harness into the passage hole in the front framework, and position the harness in the structure (figure 504).
- (4) Secure a half clamp (28-90) inside the bay, using bolts (28-70) fitted with washers (28-80).
- (5) Secure the other half clamp (28-90) by pinching the cable at the location where a protection sleeve is crimped onto the cable sheath.
- (6) Position bolts (28-70), complete with washers (28-80) to secure the half clamp to the structure.
- (7) Secure the half clamps together, using bolts (28-40), washers (28-60) and nuts (28-50).

NOTE : Before securing the harness with half clamps, make sure that the locating lug of the mobile connector is positioned towards the side wall of the structure, adjacent to the bay.

- (8) Secure the harness end which carries the fixed connector to the front frame, using bolts (28-280) fitted with washers (28-290).

NOTE : When securing the fixed connector to the nozzle front frame, ensure that the locating lug of the connector is directed towards the upper part of the structure.

- (9) Secure clip C using bolt (28-100), washer (28-120) and self-locking nut (28-110). Check the clearance existing between the harness and the edge of the wall penetration hole. (See figure 504). If this clearance is less than 5 mm, carry out the following operations:
- (a) Unscrew self-locking nut (28-110), remove bolt (28-100) and washer (28-120).
 - (b) Place a washer (28-115) between the clip and the structure.
 - (c) Fit a new bolt (28-105), washer (28-120) and self-locking nut (28-110).

OVERHAUL

- (10) Ensure that the clip is correctly located on the ring crimped to the cable sheath.
- (11) Secure clips E and F using round head bolts (28-160), plain washers (28-180) and self-locking nuts (28-170).
- (12) Secure clips D and K using hex head bolts (28-130), washers (28-150) and self-locking nuts (28-140).
- (13) Secure clips G and H using bolts (28-190), plain washers (28-210) and self-locking nuts (28-200).
- (14) Secure clip J using bolts (28-220), plain washers (28-240) and self-locking nut (28-230).
- (15) Secure clip L using bolt (28-250), plain washer (28-270) and self-locking nut (28-260).
- (16) Ensure that the harness is correctly run, and that it has no pronounced kinks or abnormal strains. Ensure that the harness main plate, located close to clip L is not obscured by the clip.
- (17) Tighten the mounting elements to the recommended torque.
- (18) At the bucket position transmitter (indicator) level, the harness passes through a gutter (28-278), which is secured to the transmitter (indicator) front support by two bolts.
Pending mounting of the gutter during installation of the bucket position transmitter (indicator), position gutter (28-278) to the harness. Locate the sheath (28-277) and slightly tighten the gutter unit clip, using bolt (28-272), washer (28-275) and nut (28-273). The gutter will be finally positioned, and nut (28-273) finally tightened when the transmitter (indicator) is installed.

E. Installation of the Bay 2 Primary Nozzle Area Transducer Electrical Harness.

Since the harnesses for bay 1 and bay 2 are symmetrical about the secondary nozzle centre line, their installation is identical. Therefore, repeat the operations given in paragraph 4.D to assemble the primary nozzle area transducer electrical harness for bay 2.

6. Installation of Link Assembly (24-10)

A. Assembly of the Link

- (1) Screw locknut (24-130) to the end-fitting assembly (24-120).
- (2) Screw the end fitting assembly, complete with locknut, onto the fork end (24-140).
- (3) Fit flanged bushings (24-150) and (24-160) into the link assembly yoke. (The shoulder on the bushings is to be inside the yoke.)

B. Install the Assembled Link

- (1) Fit flanged bushings (24-170) and (24-180) into the yoke on the structure. (The shoulder on the bushings is to be inside the yoke).
- (2) Position the spherical end fitting on the link assembly into the yoke, and secure with the shouldered hex head bolt (24-100), complete with plain washer (24-110).
- (3) Fit plain washer (24-90) and hex nut (24-80).
- (4) Tighten the nut to the recommended torque and lock using split pin (24-70).
- (5) Offer the fork end of the link up to the structure, and adjust it by screwing or unscrewing 1/2 turn at a time until shouldered hex. head bolt (24-50) can be freely inserted.
- (6) Secure the fork end using shouldered hex. head bolt (24-50) complete with plain washer (24-60).
- (7) Fit plain washer (24-40) and hex nut (24-30).
- (8) Tighten the nut to the recommended torque and lock using split pin (24-20).
- (9) Restrain the fork end with a spanner, and tighten lock nut (24-130) to the recommended torque. Wire lock.

7. Installation of Ballscrew Gearbox Support Fittings (Fig 505)

NOTE 1 : The chamfer on the internal diameter of the washers must be fitted on the bolt head side.

NOTE 2 : All ballscrew gearbox support fitting attachment bolts are fitted such that the heads are towards the front of the twin secondary nozzle.

A. Installation of Ballscrew Gearbox Support Fittings (25-10)

- (1) Position the support fitting (25-10) to the structure.
- (2) Fit bolts (25-50) complete with plain washers (25-60), fit plain washers (25-80) and self-locking nuts (25-70).
- (3) Fit bolts (25-20) complete with washers (25-30).
- (4) Restrain the bolts (25-20) using special spanners No.1 and No. 2 of tool SC 265. Fit washers (25-45) and nuts (25-40B).
- (5) Tighten all nuts to recommended torques.

B. Installation of Ballscrew Gearbox Support Fitting (25-90)

- (1) Position the support fitting (25-90) to the structure.
- (2) Fit bolts (25-130) complete with plain washers (25-140), fit plain washers (25-160) and self-locking nuts (25-150).
- (3) Fit bolts (25-100) complete with washers (25-110).
- (4) Restrain the bolts (25-100) using special spanners No. 3 and No. 4 of tool SC 265. Fit washers (25-125) and nuts (25-120B).
- (5) Tighten all nuts to recommended torques.

C. Installation of Ballscrew Gearbox Support Fitting (25-170)

- (1) Position the support fitting (25-170) to the structure.
- (2) Fit bolts (25-210) complete with plain washers (25-220), fit plain washers (25-240) and self-locking nuts (25-30).

OVERHAUL

- (3) Fit bolts (25-180) complete with washers (25-190).
- (4) Restrain bolts (25-180) using special spanners No. 1 and No. 2 of tool SC 265. Fit washers (25-205) and nuts (25-200B).
- (5) Tighten all nuts to recommended torques.

D. Installation of Ballscrew Gearbox Support Fitting (25-250)

- (1) Position the support fitting (25-250) to the structure.
- (2) Fit bolts (25-290) complete with plain washers (25-300), fit plain washers (25-320) and self-locking nuts (25-310).
- (3) Fit bolts (25-260) complete with washers (25-270).
- (4) Restrain bolts (25-260) using special spanners No. 3 and No. 4 of tool SC 265. Fit washers (25-285) and nuts (25-280B).
- (5) Tighten all nuts to recommended torques.

E. Installation of Ballscrew Gearbox Support Fitting (25-330)

Carry out the following operations for each support fitting :

- (1) Engage a bolt (25-340), complete with a plain washer (25-350) into the support (25-330) and position the support on the structure.
- (2) Position cruciform spacer (25-380), fit washer (25-370) and self-locking nut (25-360).
- (3) Fit bolts (25-340), complete with plain washers (25-350) and (25-370) and self-locking nuts (25-360).
- (4) Tighten the nuts to the recommended torque.

F. Installation of Ballscrew Gearbox Support Fitting (25-390)

Carry out the following operations for each support fitting :

- (1) Engage a bolt (25-400), complete with a plain washer (25-410) into the support fitting (25-390) and position the fitting on the structure.

OLYMPUS 593

MK.610-14-28
OVERHAUL

- (2) Position cruciform spacer (25-440), fit plain washer (25-430) and self-locking nut (25-420).
- (3) Fit bolts (29-400) complete with plain washers (25-410) and (25-430) and self-locking nuts (25-440).
- (4) Tighten the nuts to the recommended torque.

8. Installation of Welded Housing Assemblies (22-30)

Carry out the following operations for each housing assembly :

A. Position the housing assembly (22-30) against the external face of the front frame.

- (1) Secure the housing assembly using bolts (22-40) complete with plain washers (22-50).

- (2) Tighten the bolts to the recommended torques.

B. Introduce the slotted plate assembly (22-20) into the housing assembly, the openings pointing downwards and the spacers rearwards.

- (1) Provisionally secure the slotted plate using bolts (22-10).

NOTE : Final attachment of the slotted plate will be carried out when the twin secondary nozzle assembly is fitted to the aircraft.

9. Installation of the P3 Air Supply Tube Supports to the Bucket Drive Pneumatic Actuators

NOTE : The position of support brackets (21-10) and (21-170) may be adjusted by machining spacers fitted between the support brackets and the structure mating face.

A. Installation of Support Bracket (21-10)

- (1) Position the hi-lock bolt (21-140), complete with spacer washer (21-160) to the structure.
- (2) Position the plain washer (21-150) and then the support bracket (21-10).
- (3) Fit plain washer (21-130) and nut (21-120) without tightening the latter.

- (4) Between the support and the structure, fit laminated shim (21-100) and plain washer (21-90).
- (5) Insert hi-lock bolt (21-80), complete with spacer washer (21-110) in the structure, along with the laminated shim and plain washer.
- (6) Fit the plain washer (21-70) and self-locking nut (21-60) without tightening.
- (7) Fit the laminated shim (21-50) between the support fixing and the structure.
- (8) Introduce hi-lock screw (21-40) into the structure, washer (21-50) and the support bracket.
- (9) Fit plain washer (21-30) and self-locking nut (21-20).
- (10) Tighten the nuts to the recommended torques.

B. Installation of Support Bracket (21-170)

- (1) Position hi-lock bolt (21-330), complete with spacer washer (21-340) into the structure.
- (2) Position the support bracket (21-170).
- (3) Fit laminated shim (21-360) and self-locking nut (21-350) without tightening.
- (4) Fit the hi-lock bolt (21-370), complete with plain washer (21-380), the laminated shim (21-400) and self-locking nut (21-390) without tightening.
- (5) Fit plain washers (21-300) and spacer washer (21-310) between the support and the structure.
- (6) Insert the hi-lock bolt (21-290), complete with laminated shim (21-320) into the structure, along with the washers and the support brackets.
- (7) Fit plain washer (21-280) and self-locking nut (21-270) without tightening.
- (8) Fit plain washer (21-250) between the support bracket and the structure.
- (9) Introduce the hi-lock bolt (21-240) complete with laminated shim (21-260) into the structure, the plain washer (21-250) and the support bracket.

- (10) Fit plain washer (21-230) and self-locking nut (21-220) without tightening.
- (11) Place the laminated shim (21-210) between the structure and the support bracket.
- (12) Introduce the hi-lock screw (21-200) into the structure, the laminated shim (21-210) and the support bracket.
- (13) Fit the plain washer (21-190) and self-locking nut (21-180).
- (14) Tighten the nuts to the recommended torques.

10. Installation of the Convergent Section Panels (Figure 506)

- A. Operate the Rotating Fixture - tool SC 117 - to Bring the Twin Secondary Nozzle into the Horizontal Position.

CAUTION : DURING ASSEMBLY OPERATIONS, THE OPERATOR MUST TAKE CARE TO PLACE A RUBBER MAT IN THE NOZZLE ASSEMBLY, TO AVOID ANY DAMAGE DUE TO BLOWS OR SCRATCHES.

- B. Installation of the Convergent panels.

Carry out the following operations for each bay :

- (1) Locate the joint plate (11-130) under the channels in the twin secondary nozzle (Figure 506).
- (2) Position the convergent panel assembly (11-10) and secure the panel/joint plate assembly by the end countersunk head screw (11-20) and the end hex. head bolt (11-30).
- (3) Locate the joint plate (11-140) and secure it with the convergent panel (11-10) by the end countersunk head screw (11-20) and the end hex. head bolt (11-30).
- (4) Position convergent panel (11-70) and secure it to the joint plate (11-140) by the end countersunk head screw (11-80) the end hex. head bolt (11-90).
- (5) Position the joint plate (11-150) and secure it to the convergent panel (11-70) by the end countersunk head screw (11-80) and the end hex. head bolt (11-90).

OVERHAUL

- (6) Position the convergent panel (11-100) and secure it to the joint plate (11-150) by the end countersunk head screw (11-110) and the end hex. head bolt (11-120).
- (7) Locate the joint plate (11-140) and secure it to the convergent panel (11-100) by the end countersunk head screw (11-110) and the end hex. head bolt (11-120).
- (8) Locate the convergent panel (11-40) and secure it to the joint plate (11-140) by the end countersunk head screw (11-50) and the end hex. head bolt (11-60).
- (9) Assemble the other half of the convergent section repeating the operations above, (1), (2), (3), (4), (5), (6), (7), (8).
- (10) Secure the last panel installed (11-40) to the first joint plate installed (11-130) by the end countersunk head screw (11-50) and the end hex. head bolt (11-60).
- (11) Fit all countersunk head screws (11-20, 50, 80, 110) and then all the bolts (11-30, 60, 90, 120).
- (12) Check that each panel is correctly positioned.
- (13) Tighten the bolts and screws to the recommended torques.
- (14) Check that the gaps between panels are evenly distributed.

C. Replacement of a convergent panel by a new panel (11-10/40/70/100).

Do the following operations:

- (1) Remove the affected panel.
Position the new panel on the removed panel.

CAUTION: CHECK, USING 4 MEASURING RODS, THAT THE ATTACHMENT HOLES ARE CORRECTLY POSITIONED. THIS IS TO AVOID CUTTING OUT OF A PANEL, WHICH DESPITE ITS SIMILAR APPEARANCE DOES NOT CORRESPOND TO THAT OF THE ORIGINAL PANEL.

- (2) Trace the outline to prepare for the cut-out.

78-13-01

Page 520
Jan 15/88

- (3) Cut out the new panel per the given dimensions (figure 506A).

Cutting out of Panel
 Figure 506A

- (4) Adjust the panel to obtain the following clearances (figure 506B).

Installation of Panel

OVERHAUL

1. Installation of Divergent Section Panels (Figure 506)

A. Fit the six cover assemblies (20-20) which are located below the divergent panels. The holes are located as follows (view from the rear) :

- (1) Two holes at three o'clock in bay 1,
- (2) Two holes at nine o'clock in bay 1,
- (3) Two holes at three o'clock in bay 2.

* B. Installation of Lateral Divergent Panels (14-10A).

Carry out the following operations for each of the panels :

- (1) Check that all assembly elements are correctly located on the template - tool SC 196.

* 301-203-501-0 and 301-203-601-0

78-13-01

Page 520B

MK.610-14-28

OVERHAUL

- (2) Position the lateral divergent panel (14-10A) on the nozzle and fit countersunk head screws (14-20) complete with special washers (14-30).
- (3) Fit washers (14-140) between the panel and the nozzle.
- (4) Successively fit :
 - (a) countersunk head screws (14-100) complete with special washers (14-110),
 - (b) countersunk head screws (14-120) complete with special washers (14-130),
 - (c) countersunk head screws (14-40) complete with special washers (14-50),
 - (d) countersunk head screws (14-60) complete with special washers (14-70),
 - (e) countersunk head screws (14-80) complete with special washers (14-90).

*** B. Installation of Lateral Divergent Panels (14-10B)

Carry out the following operations for each panel :

- (1) Check that all assembly elements are correctly located on the template - tool SC 196.
- (2) Position the lateral panel (14-10B) on the nozzle and successively fit :
 - (a) countersunk head screws (14-20),
 - (b) countersunk head screws (14-100),
 - (c) countersunk head screws (14-120),
 - (d) countersunk head screws (14-40),
 - (e) countersunk head screws (14-60),
 - (f) countersunk head screws (14-80).

* C. Installation of the Divergent Panels at the 45 deg. Position (13-10A).

Carry out the following operations for each panel :

- (1) Check that all the assembly elements are correctly located on the template - tool SC 197.

* 301-203-501-0 and 301-203-601-0

- (2) Position the divergent panel (13-10A) on the nozzle and fit countersunk head screw (13-100) complete with special washer (13-110) and countersunk head screw (13-40) complete with special washer (13-50).
- (3) Successively fit :
 - (a) countersunk head screws (13-60) complete with special washers (13-70),
 - (b) countersunk head screws (13-20) complete with special washers (13-30),
 - (c) countersunk head screws (13-80) complete with special washers (13-90).

*** C. Installation of Divergent Panels at the 45 deg Position (13-10B).

Carry out the following operations for each panel :

- (1) Check that all assembly elements are correctly located on the template - tool SC 197.
- (2) Position divergent panel (13-10B) on the nozzle and successively fit :
 - (a) countersunk head screws (13-60),
 - (b) countersunk head screw (13-100) complete with special washer (13-110),
 - (c) countersunk head screw (13-40) complete with special washer (13-50),
 - (d) countersunk head screw (13-80) complete with special washers (13-90),
 - (e) countersunk head screws (13-20).

* D. Installation of Divergent Panels at the 45 deg. Position (13-120A).

Carry out the following operations for each panel :

- (1) Check that all assembly elements are correctly located on the template - tool SC 197.
- (2) Position divergent panel (13-120A) on the nozzle and fit countersunk head screw (13-210) complete with special washer (13-220) and countersunk head screw (13-150) complete with special washer (13-160).

(3) Successively fit :

- (a) Countersunk head screws (13-170) complete with special washers (13-180);
- (b) Countersunk head screws (13-130) complete with special washers (13-140);
- (c) countersunk head screws (13-190) complete with special washers (13-200).

*** D. Installation of the Divergent Panels at 45 deg. position (13-120B).

Carry out the following operations for each panel :

- (1) Check that all the assembly elements are correctly located on the template - tool SC 197.
- (2) Position divergent panel (13-120B) on the nozzle and successively fit :
 - (a) Countersunk head screws (13-170),
 - (b) Countersunk head screw (13-210) complete with special washer (13-220),
 - (c) Countersunk head screw (13-150) complete with special washer (13-160),
 - (d) Countersunk head screw (13-190) complete with special washer (13-200),
 - (e) Countersunk head screws (13-130).

E. Installation of Vertical Divergent Panels (12-10).

Carry out the following operations for each panel :

- (1) Check that all the assembly elements are correctly located on the template - tool SC 198.
- (2) Position panel (12-10) and fit countersunk head screws (12-20) complete with washers (12-30).
- (3) Successively fit :
 - (a) Countersunk head screws (12-60) complete with special washers (12-70),
 - (b) Countersunk head screws (12-40) complete with special washers (12-50).

OLYMPUS 593

MK.610-14-28

OVERHAUL

F. Final Installation of Divergent Panels.

- (1) Check that each panel is correctly located.
- (2) Tighten the screws to the recommended torques.
- (3) Check that the clearance between panels is equally distributed.

12. Installation of the Fire Detection Support Bracket Assemblies

A. Installation of the Support Bracket Assembly (23-10).

- (1) Locate the support bracket assembly (23-10) to the upper right hand internal section of the bay 1 front framework.
- (2) Fit the hi-lock screw (23-30) and the tubular nut (23-20) without tightening.
- (3) Position spacer washers (23-80) between the structure and the support bracket assembly (23-10).
- (4) Fit hi-lock bolts (23-60) complete with plain washers (23-70).
- (5) Fit plain washers (23-50) and self-locking nuts (23-40)
- (6) Tighten the nut to the recommended torques.

NOTE : Carry out the same operations to install the support bracket assembly (23-11) in bay 3.

B. Installation of the Support Bracket Assembly (23-90).

- (1) Locate the support bracket assembly (23-90) to the upper left hand internal section of the bay 1 front frame.
- (2) Fit the hi-lock screw (23-110) and tubular nut (23-100) without tightening.
- (3) Fit spacer washers (23-160) between the structure and the support bracket assembly (23-90).
- (4) Fit the hi-lock bolts (23-140) complete with plain washers (23-150).

PRINTED IN FRANCE

OVERHAUL

(5) Fit plain washers (23-130) and self-locking nuts (23-120).

(6) Tighten the nuts to the recommended torques.

NOTE : Carry out the same operations to install the support bracket assembly (23-171) in bay 4.

C. Installation of the Support Bracket Assembly (23-250)

- (1) Locate the support bracket assembly (23-250) to the upper LH internal section of the bay 2 front framework.
- (2) Fit the hi-lock screw (23-270) and tubular nut (23-260) without tightening.
- (3) Position the spacer washers (23-320) between the structure and the support bracket assembly (23-250).
- (4) Fit the hi-lock bolts (23-300) complete with plain washers (23-310).
- (5) Fit plain washers (23-290) and the self-locking nuts (23-280).
- (6) Tighten the nuts to the recommended torques.

NOTE : Carry out the same operations as above to fit the support bracket assembly (23-251) in bay 4.

13. Installation of the Side Fairing Assemblies and Heat Shields

A. Installation of the Side Fairing Assemblies (Figure 507).

(1) Definition of Spacers

When installing the fairing assemblies, it will sometimes be necessary to fit spacers between the structure and the fairing assembly, in order to ensure a continuous aerodynamic form of the secondary nozzle external walls. In the same way, spacers may be fitted between the fairing assemblies and the brackets so as to obtain an assembly free from built-in stresses. These spacers are to be produced from Z 10 CNT 18 (P 3301). Their dimensions will be defined on assembly.

(2) Installation of the LH Fairing Assembly (9-10).

- (a) Check that all the assembly elements are correctly located on the rack - tool SC 199.

OLYMPUS 593

MK.610-14-28

OVERHAUL

- (b) Position the fairing assembly (9-10) and secure it using special countersunk head screws (9-20) and self-locking nuts (9-30), without tightening.
- (c) Using hand pressure, bring the central section of the fairing assembly into contact with the structure.
- (d) Using a straight edge, check that the panel is flush with the structure. If necessary, fit spacers at the four central mounting points.
- (e) Next check the clearance between the fairing assembly and the bracket. Fit spacers if required (at the same mounting points as in operation (4)).
- (f) Fit the four central countersunk head screws (9-250) and self-locking nuts (9-260).
- (g) Tighten the nuts to the specified torques.
- (h) Check that the panel/structure are flush at the level of the four adjacent upper mounting points, and carry out operations (3), (4) and (5).
- (i) Fit the two special countersunk head screws (9-250) and the self-locking nuts (9-260), along with the two countersunk head screws (9-230) and self-locking nuts (9-240).
- (j) Tighten the nuts to the specified torques.
- (k) Carry out operations (8), (9) and (10) for the four symmetrical mountings.
- (l) By hand pressure, at the level of the reverser bucket mounting points, bring the fairing assembly into contact with the structure.
- (m) Using a straight edge, check that the panel is flush with the structure and fit spacers if required.
- (n) Successively fit :
 - 1 Special countersunk head screws (9-200), plain washers (9-220) and self-locking nuts (9-210)
 - 2 Special countersunk head screws (9-170), plain washers (9-190) and self-locking nuts (9-180).

- 3 Special countersunk head screws (9-140), plain washers (9-160) and self-locking nuts (9-150).
- 4 Special countersunk head screws (9-110), plain washers (9-130) and self-locking nuts (9-120),
- 5 Special countersunk head screws (9-70), spacers (9-100), washers (9-90) and self-locking nuts (9-80).

- (o) Torque the nuts to the specified values.
- (p) Using hand pressure, bring the edge segments of the fairing assembly into contact with the structure.
- (q) Check with a straightedge that the panel is flush with the structure. Fit spacers, if necessary.

NOTE : If there is need for spacing, remove nut (9-30) and screw (9-20), and remount them when the spacers have been fitted.

- (r) Put angle brackets (9A-577) and (9A-727) in position.
- (s) Fit special countersunk head screws (9-40), plain washers (9-60) and self-locking nuts (9-50).
- (t) Torque the nuts to the specified values.
- (u) Make sure that the panel is flush with the structure.

NOTE : Proceed in the same way to install rear fairing assembly (9-11) on RH twin secondary nozzle assy.

(3) Installation of RH Side Fairing Assembly (9-270)

- (a) Ascertain that all elements of the assembly are properly arranged on the template - tool SC 199.
- (b) Put side fairing (9-270) in position and secure it with special countersunk head screws (9-280) and self-locking nuts (9-290) without locking them tight.
- (c) By hand pressure, bring the central section of the fairing assy into contact with the structure.
- (d) Using a straightedge, ascertain that the panel is flush with the structure. If necessary, fit spacers at the four central mounting points.

78-13-01

OVERHAUL

- (e) Next check the clearance between fairing assembly and bracket. If necessary, fit spacers at the four central mounting points.
 - (f) Fit the four central countersunk head screws (9-510) and self-locking nuts (9-520).
 - (g) Tighten the nuts to the specified torques.
 - (h) Check that the fairing is flush with the structure at the four adjacent upper mounting points and carry out operations (3), (4) and (5).
 - (i) Next fit two countersunk head screws (9-510) and locking nuts (9-520) along with the two countersunk head screws (9-490) and self-locking nuts (9-500).
 - (j) Tighten the nuts to the specified torques.
 - (k) Carry out operations (8), (9) and (10) for the four symmetrical mounting points.
 - (l) By hand pressure, bring the fairing into contact with the structure at the bucket mounting point level.
 - (m) Using a straightedge, check that the panel is flush with the structure. Fit spacers if necessary.
 - (n) Successively fit :
 - 1 Countersunk head screws (9-460), plain washers (9-480) and self-locking nuts (9-470).
 - 2 Countersunk head screws (9-430), plain washers (9-450) and self-locking nuts (9-440).
 - 3 Countersunk head screws (9-400), plain washers (9-420) and self-locking nuts (9-410).
 - 4 Countersunk head-screws (9-370), plain washers (9-390) and self-locking nuts (9-380).
 - 5 Countersunk head-screws (9-330), spacers (9-360), plain washers (9-350) and self-locking nuts (9-340).
 - (p) Tighten the nuts to the specified torques.
 - (q) By hand pressure, bring the ends of the fairing assembly into contact with the structure.
 - (r) With a straightedge, check that the panel is flush with the structure. Fit spacers if required
- NOTE : If there is need to fit spacers, remove self-locking nut (9-290) and countersunk

head screw (9-280). Remount them after fitting spacers.

- (s) Put angle brackets (9A-577) and (9A-727) in position.
- (t) Fit countersunk head screws (9-300), plain washers (9-320) and self-locking screws (9-310).
- (u) Torque the nuts to the specified values.
- (v) Check that the panel is flush with the structure.

NOTE : Proceed in the same way to install fairing assembly (9-271) on the RH twin secondary nozzle assembly.

B. Installation of Heat Shields

(1) Installing Heat Shield (9A-530).

- (a) Locate head shield (9A-530) on the side fairing, inserting shim (9A-570), and fix countersunk head screws (9A-560).
- (b) Mount hex head bolts (9A-540), together with plain washers (9A-550).
- (c) Make sure that the shield is firmly seated and does not damaged the bracket.
- (d) Torque screws and bolts to the specified values.

(2) Installing Heat Shield (9A-580)

- (a) Locate heat shield (9A-580) on the side fairing, inserting shim (9A-620) and fix countersunk head screws (9A-610).
- (b) Mount hex head bolts (9A-590) together with plain washers (9A-600).
- (c) Make sure that the shield is firmly seated and does not damaged the bracket.
- (d) Torque screws and bolts to the specified values.

(3) Installing Heat Shield (9A-630).

- (a) Locate heat shield (9A-630) on the side fairing, inserting shim (9A-670), and fix countersunk head screws (9A-660).
- (b) Mount hex head bolts (9A-640) together with plain washers (9A-650).
- (c) Make sure that the shield is firmly seated and

does not injure the bracket.

(d) Torque screws and bolts to the specified values.

(4) Installing Heat Shield (9A-680)

(a) Locate heat shield (9A-680) on the side fairing, inserting shim (9A-720), and fix countersunk head screws (9A-710).

(b) Mount hex head bolts (9A-690), together with plain washers (9A-700).

(c) Make sure the shield is firmly seated and doesn't damaged the bracket.

(d) Torque screws and bolts to the specified values.

(5) Installing Heat Shield (9B-730)

(a) Locate heat shield (9B-730) on the side fairing.

(b) Mount hex head bolts (9B-780), together with plain washers (9B-790).

(c) Mount hex head bolts (9B-760), together with plain washers (9B-770).

(d) Mount hex head bolts (9B-740), together with plain washers (9B-750).

(e) Make sure the shield is firmly seated and doesn't damaged the bracket.

(f) Torque screws and bolts to the specified values.

(6) Installing Heat Shield (9B-800).

(a) Locate heat shield (9B-800) on the side fairing.

(b) Mount hex head bolts (9B-850), together with plain washers (9B-860).

(c) Mount hex head bolts (9B-830), together with plain washers (9B-840).

(d) Mount hex head bolts (9B-810), together with plain washers (9B-820).

(e) Make sure the shield is firmly seated and does not damaged the bracket.

(f) Torque screws and bolts to the specified values.

(7) Installing Heat Shield (9B-870).

(a) Locate heat shield (9B-870) on the side fairing.

78-13-01

- (b) Mount hex head bolts (9B-920), together with plain washers (9B-930).
 - (c) Mount hex head bolts (9B-900), together with plain washers (9B-910).
 - (d) Mount hex head bolts (9B-880), together with plain washers (9B-870).
 - (e) Make sure the shield is firmly seated and does not damaged the bracket.
 - (f) Torque screws and bolts to the specified values.
- (8) Installing Heat Shield (9B-940)
- (a) Locate heat shield (9B-940) on the side fairing.
 - (b) Mount hex head bolts (9B-990), together with plain washers (9B-995):
 - (c) Mount hex head bolts (9B-970), together with plain washers (9B-980).
 - (d) Mount hex head bolts (9B-950), together with plain washers (9B-960).
 - (e) Make sure the shield is firmly seated and does not damaged the bracket.
 - (f) Torque screws and bolts to the specified values.

14. Installation of the Support Assemblies to the Rear Framework

A. Installation of Support Assemblies (7-10).

Carry out the following operations for each support assembly.

- (1) Position the support assembly (7-10) on the structure.
- (2) Fit the bolt (7-140) complete with plain washer (7-150). Fit plain washer (7-130) and self-locking nut (7-120), without tightening.
- (3) Fit spacer (7-70) between the support assembly (7-10) and the structure.
- (4) Fit bolts (7-60) complete with washers (7-65). Fit plain washers (7-55) and self-locking nuts (7-50).
- (5) Fit bolts (7-30) complete with washers (7-35). Fit plain washers (7-40) and self-locking nuts (7-20).
- (6) Fit bolt (7-100) complete with plain washer (7-110). Fit plain washer (7-90) and self-locking nut (7-80).
- (7) Tighten the nuts to the specified torques.

OVERHAUL

- (3) Fit spacer (7-220) between the support assembly (7-160) and the structure.
- (4) Fit bolts (7-210) complete with washers (7-215). Fit plain washers (7-205) and self-locking nuts (7-200).
- (5) Fit bolt (7-180) complete with washer (7-185). Fit plain washer (7-190) and self-locking nut (7-170).
- (6) Fit bolt (7-250) complete with plain washer (7-260) fit plain washer (7-240) and self-locking nut (7-230).
- (7) Tighten the nuts to the recommended torques.

15. Installation of Heat Shield Assemblies to the Rear Frame.

NOTE : For the position of the various components, and the assembly elements, refer to figure 508A.

A. Installation of the Bay 1 Upper Heat Shield Assembly.

- (1) Check that all the assembly elements are correctly located on the template - tool SC 266.
- (2) Fit the bushes (5-330) to the structure.
- (3) At the end of the heat shield assembly (5-260), fit retaining plates (5-90) and (5-120) using countersunk head screws (5-80) and (5-110) respectively. Also fit nuts (5-70) and (5-100) without tightening.
- (4) Position the heat shield assembly to the rear framework and progressively fix it using :
 - (a) Bolts (5-310) complete with washers (5-320).
 - (b) Bolts (5-340) complete with washers (5-350).
 - (c) Bolts (5-360A) complete with washers (5-370A).
- (5) Tighten the heat shield retaining elements to the recommended torques.
- (6) Withdraw the locking wire which holds the lower seal element (5-190) to the seal assembly (5-170). Fit this plate to the heat shield assembly at the seventh and eighth bolt position from the left.

 - (4) Position the heat shield assembly to the rear frame and secure it using successively :
 - (a) Bolts (6-680) and washers (6-690)
 - (b) Bolts (6-710) and washers (6-720)
 - (c) Bolts (6-730A) and washers (6-740A)
 - (5) Tighten the heat shield retaining elements to the recommended torques.
 - (6) Withdraw the retaining wire which retains the lower seal plate (6-560) to the seal assembly (6-540) and fit this plate to the heat shield at the seventh and eighth screw from the right.
 - (7) Fit the seal assembly (6-520) and nuts (6-530) without tightening.
 - (8) Fit the seal assembly (6-500), engaging it under retaining plate (6-460). Fit nuts (6-510) without tightening.
 - (9) Simultaneously fit the seal assemblies (6-540) and (6-570). Fit nuts (6-550) and (6-580).
 - (10) Successively fit :
 - (a) Seal assembly (6-590) and nuts (6-600) without tightening.
 - (b) Seal assembly (6-610), engaging it under retaining plate (6-490). Fit nuts (6-620) without tightening.
 - (11) Check the position of all the seals and that they overlap correctly.
 - (12) Tighten the elements which retain the seals, and retaining plates, to the recommended torques.
- G. Installation of the Bay 3 Lower Heat Shield Assembly.
- (1) Fit heat shield assembly (6-631) and its seal as per instructions in paragraph 15.F.

78-13-01

OVERHAUL

H. Installation of Bay 4 Lower Heat Shield Assembly.

- (1) Fit heat shield assembly (6-621) and its seal as per instructions in paragraph 15.E.

16. Installing the Blanking Plates onto the Ballscrew Gearbox Recesses.

NOTE : For the arrangement of the various assembly component, see Fig. 508 B.

A. Installing Upper Blanking Plate (22A-85), Bay 1.

- (1) Place washers (5-305) and (5-375) on the heat shield.
- (2) Put blanking plate (22A-85) in position.
- (3) Fit shim(s) (22A-130).
- (4) Screw in bolts (22A-100) (22A-110) and (22A-120) without locking tight, together with their washers (22A-105), (22A-115) and (22A-125).
- (5) Screw in, but do not tighten, bolt (22A-90) with its washer (22A-95).
- (6) Mount stiffener (5-30).
- (7) Screw in, but do not tighten, bolts (5-10) with associated washers (5-20).
- (8) Screw in, but do not tighten, bolt (5-360B) with its washer (5-370B).
- (9) Fit bolt (5-290) with its washer (5-300), and screw on nut (5-270) and spacer (5-280) without tightening.
- (10) Tighten bolts and nut to recommended torques.

B. Installing Upper Blanking Plate (22C-360), Bay 1.

- (1) Place washers (22C-375), (5-305) and (5-375) on the heat shield.
- (2) Put blanking plate (22C-360) in position.
- (3) Screw in, but do not tighten, bolts (22C-380), together with associated washers (22C-385).

OVERHAUL

F. Installing Lower Blanking Plate (22C-400), Bay 1.

- (1) Place washers (6-305) and (6-375) and spacer (22C-415) on the heat shield.
- (2) Put lower blanking plate (22C-400) in position.
- (3) Screw in, but do not tighten, bolts (22C-420) with associated washers (22C-425).
- (4) Fit bolt (22C-405) with washer (22C-410) without tightening.
- (5) Mount stiffener (6-30).
- (6) Screw in, but do not tighten, bolt (6-10) together with associated washers (6-20).
- (7) Screw in bolt (6-360B) with washer (6-370B) without tightening.
- (8) Fit bolt (6-290) with washer (6-300), and screw on nut (6-270) with spacer (6-280) without tightening.
- (9) Tighten bolts and nuts to recommended torques.

G. Installing Lower Blanking Plate (22D-460), Bay 2.

- (1) Place spacer (22D-475) and washers (6-675) and (6-745).
- (2) Put lower blanking plate (22D-460) in position.
- (3) Screw in, but do not tighten, bolts (22D-480) with associated washers (22D-485).
- (4) Fit bolt (22D-465) with washer (22D-470) without tightening.
- (5) Mount stiffener (6-430).
- (6) Screw in but do not tighten, bolts (6-410) with washers (6-420).
- (7) Screw in bolt (6-730B) with washer (6-740B) without tightening.
- (8) Fit bolt (6-660) with washer (6-670), and screw on nut (6-640) with spacer (6-650) without tightening.

(9) Tighten bolts and nut to recommended torques.

H. Installing Lower Blanking Plate (22B-230), Bay 2

- (1) Place washers (6-675) and (6-745).
- (2) Put lower blanking plate (22B-230) in position.
- (3) Fit shim(s) (22B-260).
- (4) Screw in, but do not lock tight, bolts (22B-245) and (22B-250) with washer (22B-255).
- (5) Screw in bolt (22B-235) with washer (22B-240) without tightening.
- (6) Mount stiffener (6-400).
- (7) Screw in, but do not lock tight, bolts (6-380) with washers (6-390).
- (8) Screw in, but do not lock, bolt (6-730B) with washer (6-740B).
- (9) Fit bolt (6-660) with washer (6-670), and screw on nut (6-640) with spacer (6-650).
- (10) Tighten bolts and nut to recommended torques.

I. Installing the Bay 4 Upper Blanking Plates.

- (1) Install upper blanking plate assy (22A-86) as instructed under 16-A.
- (2) Install upper blanking plate assy (22C-361) as instructed under 16-B.

J. Installing the Bay 4 Lower Blanking Plates.

- (1) Install lower blanking plate assy (22A-166) as instructed under 16-E.
- (2) Install lower blanking plate assy (22C-401) as instructed under 16-F.

K. Installing the Bay 3 Upper Blanking Plates.

- (1) Install upper blanking plate assy (22D-501) as instructed under 16-C.

78-13-01

Page 546

OVERHAUL

- (2) Install upper blanking plate assy (22B-286) as instructed under 16-D.

L. Installing the Bay 3 Lower Blanking Plates.

- (1) Install lower blanking plate assy (22D-461) as instructed under 16-G.
- (2) Install lower blanking plate assy (22B-231) as instructed under 16-H.

17. Installation of Bucket Position Transmitters (Indicators)

- A. Operate the rotating stand - tool SC 117 - to bring the twin secondary nozzle assembly into the vertical position.

- B. Installation of the welded bracket assemblies (16-220)
Carry out the following operations for each bracket assembly :

- (1) Insert a countersunk head screw (16-200) into its housing, from inside the bay.
- (2) Locate the welded bracket assembly (16-220) on the screw in the transmitter (indicator) housing.
- (3) Fit self-locking nut (16-210).
- (4) Fit the other countersunk head screws (16-200) and self-locking nuts (16-210).
- (5) Tighten the nuts to the recommended torques.

- C. Installation of Welded Bracket Assemblies (16-250).

Carry out the following operations for each of the bracket assemblies :

- (1) Insert a countersunk head screw (16-230) into its housing, from inside the bay.
- (2) Locate the welded bracket assembly (16-250) on the screw in the transmitter (indicator) housing.
- (3) Fit self-locking nut (16-240).
- (4) Fit the other countersunk head screws (16-230) and self-locking nuts (16-240).
- (5) Tighten the nuts to the recommended torques.

OVERHAUL

D. Installation of Bucket Position Transmitters (Indicators)
(16-70)

NOTE : Before installation, check that the transmitter
(indicator) is in the locked zero position (Fig. 509);

Carry out the following operations for each of the transmitters (indicators) :

- (1) Fit the appropriate spherical bearings (16-120) and (16-170) to the spherical bearing housings (16-130) and (16-180).
- (2) Fit the spherical bearing assembly (16-160) and secure it with bolts (16-140) and plain washers (16-150).
- (3) Locate the transmitter (indicator) (16-70) by introducing the front location peg into the spherical bearing assembly (16-160). The manual lock is located on the transmitter (indicator) housing access door side.
- (4) Fit the spherical bearing assemblies (16-100) to the side mounting pegs and secure them with bolts (16-80) complete with washers (16-90).
- (5) Measure the clearance between the spherical bearing internal ring and the mounting peg front shoulder, and determine the thickness of the shim (16-910), in order to obtain the required clearance.

$$\begin{aligned} \text{Thickness of the shim (mm)} &= \\ \text{measured clearance} &- 1,27 \begin{array}{l} + 1,02 \\ - 0,0 \end{array} \text{ mm} \\ & \quad (0.050 \begin{array}{l} + 0.040 \\ - 0 \end{array} \text{ in.}) \end{aligned}$$

- (6) Withdraw bolts (16-140) and washers (16-150).
- (7) Fit shim (16-190) to the thickness determined above, between the bracket and the spherical bearing (16-160) assemblies.
- (8) Fit the lower bolt (16-140), complete with washer (16-150).
- (9) Position the channel unit (28-278) and secure it using bolts (16-140) and washers (16-150).
- (10) Check that the primary nozzle area transducer harness is correctly installed and tighten nut (28-300) and bolts (16-140) to the recommended torques.

OVERHAUL

PRINTED IN FRANCE

- (11) Adjust the clearance between the spherical bearing inner rings and the side trunnion shoulders as follows :
 - (a) Measure the existing clearance.
 - (b) Determine the thickness of the shim :
$$\begin{array}{rcl} (\text{mm}) & = & 1,27 \quad + 1,02 \\ & & \quad - 0,0 \quad - \text{measured clearance} \\ \\ (\text{in.}) & = & 0.050 \quad + 0.040 \\ & & \quad - 0 \quad - \text{measured clearance} \end{array}$$
- (12) Withdraw bolts (16-80) and washers (16-90).
- (13) Remove the spherical bearing assemblies (16-130) and fit shims (16-100) as determined above.
- (14) Refit the spherical bearing assemblies (16-100) and secure them using bolts (16-80) and washers (16-90).
- (15) Tighten the bolts to the recommended torques.
- (16) Check the clearance at all three mounting points.
- (17) Check the clearance between the transmitter (indicator) and the structure (min. = 3,8 mm (0.115 in.)).
- (18) Remove the protective caps fitted to the transmitter (indicator) and electrical harness connectors.
- (19) Plug connectors H, I, J into the transmitter (indicator).
- (20) Tighten the nuts to the recommended torques and wire lock.

18. Installation of Ballscrew Gearboxes

NOTE 1 : Before installing the ballscrew gearboxes, check that they are in the retracted position.

NOTE 2 : The bolts which attach the ballscrew gearboxes to their appropriate support assemblies must be fitted such that the castellated nuts are accessible via the side access doors (for the lateral attachment points). The heads of the central attachment bolts must face the inside of the bay.

78-13-01

Page 551

Apr 30/93

OLYMPUS 593

MK.610-14-28

OVERHAUL

A. Carry out the following operations for each ballscrew gearbox :

- (1) Position the ballscrew gearbox (16-10) such that the anti-rotation peg on the support fitting engages in the ballscrew gearbox attachment yoke.
- (2) Fit bolt (16-50) complete with plain washer (16-60).
- (3) Fit plain washer (16-40) and castellated nut (16-30).
- (4) Tighten the nut to the recommended torque and lock it using split pin (16-20).

B. Position pieces of polyurethane foam between the ballscrew gearbox bodies and the structure, and secure the former to the latter using brass wire.

Hold the ballscrew gearbox fast by the use of tool SC 268.

19. Installation of Flexible Shafts

CAUTION : DO NOT KINK THE FLEXIBLE SHAFTS.

DO NOT REMOVE THE FLEXIBLE SHAFT FROM ITS SHEATH.

A. Preparation for Installation.

Before installing the flexible shaft on the structure, carry out the following operations for each of them :

- (1) Check the difference in the length between the flexible shaft and its sheath. This difference must conform to the values given below :

I P L Item Number Value of Shaft/Sheath Δl

15-10	63,25 to 72,99 mm	(2.49 to 2.87 in.)
15-20	66,80 to 76,45 mm	(2.63 to 3.01 in.)
15-30	60,96 to 70,61 mm	(2.40 to 2.78 in.)
15-40	60,96 to 70,61 mm	(2.40 to 2.78 in.)
15-50	64,26 to 73,91 mm	(2.53 to 2.91 in.)
15-150	61,47 to 71,12 mm	(2.42 to 2.80 in.)
15-160	68,07 to 77,72 mm	(2.68 to 3.06 in.)
15-170	60,96 to 70,61 mm	(2.40 to 2.78 in.)

- (2) If the difference in length is too low (the sheath tends to shrink during storage), proceed as follows :

78-13-01

OLYMPUS 593

MK. 610-14-28

OVERHAUL

sneema

- (a) Secure the end of the sheath (with the larger diameter collar) in a vice fitted with suitable soft jaws.
 - (b) On the other end flange of the sheath, fit the flange for stretching the sheath - tool SC 267 - and connect the dynamometer.
 - (c) Stretch the flexible shaft sheath by applying a load of 15 to 20 kg (30 to 40 lb).
 - (d) Measure the difference in length.
 - (e) If this difference is too low, repeat operations (a), (b), (c), (d).
- (3) Ensure that the protective springs on the flexible shafts are in their appropriate position, as shown on figure 510.

B. Installation of Flexible Shafts (Figure 511).

NOTE: Check that the flexible shaft closed retaining flanges are in place on the large collar end.

CAUTION: THE FLEXIBLE SHAFTS MUST BE INTRODUCED INTO THE GUIDE TUBES BY PULLING ON THE SHEATHS USING TOOL SC 188.
WHEN INSTALLING THE FLEXIBLE SHAFTS INTO THE STRUCTURE, OR PENDING ATTACHMENT TO THE TRANSMITTER (INDICATORS) OR THE PNEUMATIC DRIVE ACTUATORS, FIT A CABLE SUPPORT (TOOL SC 187) TO EACH END OF EACH SHEATH, TO AVOID THE FLEXIBLE CORE SLIDING OUT OF THE SHEATH.

- (1) Position flexible shaft (15-50) in the structure (bay 1 or 3).
 - (a) Insert hexagon (1) of the flexible shaft into bucket ballscrew gearbox 3.
 - (b) Secure the flexible shaft flange to the bucket ballscrew gearbox using nuts (15-56).
 - (c) Insert hexagon (2) of the flexible shaft into the bucket position transmitter (indicator), rotating it plus or minus thirty degrees using spanner tool SC 249.

- (d) Measure the clearance between the collar and the bucket position transmitter (indicator):
- If the clearance is less than 3 mm (0.118 in.) secure the flexible shaft flange to the bucket position transmitter (indicator) using bolts (15-52).
 - If the clearance lies between 3 and 5 mm (0.118 and 0.197 in.) insert a 4 mm (0.157 in.) shim (15-54) between the bucket position transmitter (indicator) and the flexible shaft flange and secure the flange using bolts (15-52).
 - If the clearance is greater than 5 mm (0.197 in.) insert a 6 mm (0.236 in.) shim (15-55) between the bucket position transmitter (indicator) and the flexible shaft flange and secure the flange using bolts (15-53).
- (2) Position flexible shaft (15-30) in the structure (bay 1 or 3) by inserting it into the guide-tube, from ballscrew gearbox 2 toward gearbox 3.
- (a) Insert hexagon (2) of the flexible shaft into ballscrew gearbox 3.
- (b) Secure the flexible shaft flange to the bucket ballscrew gearbox using nuts (15-35).
- (c) Insert hexagon (2) of the flexible shaft into ballscrew gearbox 2, rotating it anticlockwise, sixty degrees maximum (looking in from the end of the flexible shaft) using spanner-tool SC 249.
- (d) Measure the clearance between the collar and ballscrew gearbox 2.
- If the clearance is less than 3 mm (0.118 in.), secure the flexible shaft flange to ballscrew gearbox 2 using nuts (15-35).
 - if the clearance lies between 3 and 5 mm (0.118 and 0.197 in.) insert a 4 mm (0.157 in.) shim (15-36 in.) between the flange and the ballscrew gearbox.
 - if the clearance is greater than 5 mm (0.197 in.) insert a 6 mm (0.236 in.) shim (15-37) between the flange and the ballscrew gearbox.
- (3) Position the flexible shaft (15-170) in the structure (bay 2 or 4) by inserting it into the guide-tube from ballscrew gearbox 4 toward ballscrew gearbox 1.

OVERHAUL

- (a) Insert hexagon (1) of the flexible shaft into ballscrew gearbox 4.
- (b) Secure the flexible shaft flange to the ballscrew gearbox using nuts (15-175).
- (c) Insert hexagon (2) of the flexible shaft into ballscrew gearbox 1, rotating it clockwise sixty degrees maximum (looking in from the end of the flexible shaft) using spanner - tool SC 249.
- (d) Measure the clearance between the collar and ballscrew gearbox 1.
 - if the clearnce is less than 3 mm (0.118 in.) position the open flange and secure it using nuts (15-172).
 - if the clearance lies between 3 and 5 mm (0.118 and 0.197 in.), insert a 4 mm (0.157 in.) shim (15-173) between the ballscrew gearbox and the open flange.
 - if the clearance is greater than 5 mm (0.197 in.) insert a 6 mm (0.236 in.) shim (15-174) between the ballscrew gearbox and the open flange.
- (4) Position the flexible shaft (15-160) in the structure (bay 2 or 4).
 - (a) Insert hexagon (1) of the flexible shaft into ballscrew gearbox 1.
 - (b) Secure the flexible shaft flange of ballscrew gearbox 1 using nuts (15-167).
- (5) Position the flexible shaft (15-150) in the structure (bay 2 or 4) inserting it in the guide-tube from the bucket pneumatic drive actuator toward ballscrew gearbox 2.
 - (a) Insert hexagon (1) of the flexible shaft into ballscrew gearbox 1.
 - (b) Position the open flange and secure it using nuts (15-157).
- (6) Tighten the securing components to the specified torques.

OVERHAUL

20. Installation of P3 Air Feeds

A. Installation of Pipe Assembly (19-100).

- (1) Locate the spherical bearing (19-90) in its housing on the pipe assembly (19-100).
- (2) Position the pipe assembly in the housing for the bucket drive pneumatic actuator of bay 1. Introduce the threaded section through the front frame until the collar abuts, the pipe being correctly centered.
- (3) Fit pipe end nut (19-40) without tightening.
- (4) Align the tube flange hole with the hole in the support bracket (21-10).
- (5) Measure the clearance between the rear face of the flange and the front face of the support bracket, and machine spacer (19-60) in line with the measured clearance.
- (6) Secure the pipe assembly to the support bracket, using bolt (19-70), complete with washer (19-80) and fit nut (19-50).
- (7) Tighten nuts (19-50) and, subsequently, (19-40) to the recommended torques and wire-lock the pipe end nut (19-40).
- (8) Fit cover plates (19-20) and (19-30), ensuring that they overlap but do not touch the pipe.
- (9) Fit bolts (19-10) and tighten to the recommended torque.

NOTE : The cover plates (19-20) and (19-30) have two common fixing points.

B. Installation of Pipe Assembly (19-200).

- (1) Locate the spherical bearing (19-190) in its housing on the pipe assembly (19-200).
- (2) Position the pipe assembly in the housing for the bucket drive pneumatic actuator on bay 2. Introduce the threaded section through the front frame until the collar abuts, the pipe being correctly centered.

- (2) Fix the angle bracket (18-550) using bolts (18-540), plain washers (18-530) and self-locking nuts (18-520). (The nuts are located on the crossfeed isolation valve side).
- (3) Fit the P clip (18-510) to the tube assembly (18-430).
- (4) Couple the tube assembly (18-430) to the P3 air elbow assembly (17-170).
 - (a) Fit dee head bolts (18-470), spherical washers (18-460) and (18-450) and nuts (18-440) (nuts (18-440) being on the crossfeed isolation valve side).
 - (b) Fit bolts (18-476) complete with spherical washers (18-477) and (18-478), washers (18-474) and nuts (18-472). (The nut (18-472) being on the pneumatic actuator housing side).
- (5) Secure P clip (18-510) to angle bracket (18-550) using bolt (18-500), plain washer (18-490) between the clip and angle bracket and plain washer (18-490) and self-locking nut (18-480).
- (6) Position the P clip (18-420) to the tube assembly (18-340).
- (7) Couple the tube assembly (18-340) to the P3 air elbow assembly (17-110) using bolts (18-380), spherical washers (18-370) and (18-360) and nuts (18-350). (The nuts (18-350) being on the crossfeed isolation valve side).
- (8) Fix the P clip (18-420) to the angle bracket (18-550) using bolt (18-410), a plain washer (18-420) between the clip and the angle bracket, and a plain washer (18-420) and self-locking nut (18-390).
- (9) Secure the half clamp assembly (18-330) using bolt (18-320), ensuring the tubes are secured in position.
- (10) Tighten the mounting elements to the recommended torques.
- (11) Wire locknuts (18-440) and (18-350).

B. Installation of Elbow Assemblies.

- (1) Couple the elbow assembly (18-190) to the tube assembly (18-430), using dee head bolts (18-230), spherical washers (18-220) and (18-210) and nuts (18-200).
- (2) Fit the spherical bearing (18-180) to the lug on the elbow assembly (18-110).
- (3) Couple the elbow assembly (18-110) to the tube assembly (18-340), using dee head bolts (18-150), spherical washers (18-140) and (18-130), and nuts (18-120).
- (4) Tighten the mounting elements to the recommended torques.
- (5) Wire locknuts (18-200) and (18-120) in pairs.

C. Installation of the Mounting yoke (18-620).

- (1) Locate the mounting yoke (18-620) to the rear wall of the crossfeed isolation valve housing.
- (2) Retain the yoke using :
 - (a) bolts (18-590), plain washers (18-580) and self-locking nuts (18-570). (For the upper and lower LH mounting points).
 - (b) fit clip (18-597) and secure it and the yoke, using bolt (18-593), plain washer (18-580) and self-locking nut (18-570). (For the upper RH mounting point).
- (3) Fit the flanged bushings (18-600) and (18-610) to the yoke. (The bushing shoulders to be located to the inside of the yoke).

D. Installation of Pivot (18-660).

- (1) Position the pivot (18-660) on the rear wall of the crossfeed isolation valve housing, and secure it with two bolts (18-650), two plain washers (18-640) and two self-locking nuts (18-630).
- (2) Fit bracket (18-670) to the pivot.
- (3) Secure the bracket to the pivot, using two bolts (18-650), two plain washers (18-640) and two self-locking nuts (18-630).

78-13-01

Page 565
Aug 31/79

(4) Tighten the nuts to the recommended torques.

E. Installation of the Crossfeed Isolation Valve (18-310).

- (1) Fit spherical bearing (18-280) to the isolation valve support bracket (18-270). Carry out the same operation with the support bracket (18-290) and the spherical bearing (18-280).
- (2) Carry out the following operations to fit the isolation valve support bracket (18-270) or (18-290) (see Fig. 512, sheet 2.) :
 - (a) Fit the spherical bearing (18-280) to the isolation valve support bracket (18-270).
 - (b) Unlock and withdraw the three bolts (18-260) which secure the isolation valve housing.
 - (c) Fit the isolation valve support bracket and secure it with three bolts (18-260).

NOTE : The valve support bracket must be held between the heads of bolts (18-260) and the isolation valve housing.

- (d) Tighten the bolts to the recommended torque and wire lock them.
- (3) Fit collar clamps (18-160) and (18-240) to elbow assemblies (18-110) and (18-190).
- (4) Remove the blanks fitted to the isolation valve air inlets.
- (5) Push the air feed tubes to one side and position the crossfeed isolation valve to its mounting point.
- (6) Fit sealing rings (18-170) and (18-250).
- (7) Fit and tighten collar clamps (18-240) and (18-160).

F. Installation of the Mounting Link Assembly (18-10).

- (1) Fit locknut (18-90) to the rod end (18-80).
- (2) Screw the rod end clevis (18-100) to the rod end.
- (3) Fit flanged bushings (18-60) and (18-70) to the rod end clevis, with the bushing shoulders to the inside of the yoke.

OLYMPUS 593

MK. 610-14-28

OVERHAUL

sneema

- (4) Adjust the between-centres distance of the link to the nominal dimension of 63,11 mm (6.422 in) without tightening the locking nut (18-90).
 - (5) Set the link assembly to the mounting yoke (18-620).
 - (6) Fit bolt (18-50), complete with washers (18-55) and (18-40) and castellated nut (18-30).
 - (7) Position the link clevis end to the lug on the elbow and adjust the length by screwing or unscrewing half-a-turn at a time, until bolt (18-50) can be freely inserted.
 - (8) Secure the clevis rod end with bolt (18-50), plain washer (18-40) and castellated nut (18-30).
 - (9) Tighten the nuts (18-30) to the recommended torques and lock with split pins (18-20).
- G. Connecting the Electrical Wiring Harness (26-10) to the Crossfeed Isolation Valve
- (1) Remove the blanking caps fitted to the isolation valve receptacles.
 - (2) Remove the adhesive tape which secures the electrical wiring end to the structure (see paragraph 5.C.(15)).
 - (3) Remove the blanking caps fitted to connectors G and F of the electrical wiring harness (26-10).
 - (4) Fix the wiring harness (26-10) to the bracket (18-670) using clip Q (see figure 503), bolt (26-230) and nut (26-220).
 - (5) Plug in the connectors.
 - (a) The connector identified G to the upper part of the crossfeed isolation valve.
 - (b) The connector identified F to the lower part of the crossfeed isolation valve.
 - (6) Tighten the mounting elements to the recommended torques.
 - (7) Wire lock the connector nuts.

22. Installation of Bucket Drive Pneumatic Actuators (Figure 513)

CAUTION: FAILURE TO STRICTLY OBSERVE THE WHOLE BUCKET DRIVE PNEUMATIC ACTUATOR INSTALLATION PROCEDURE IN ITS ENTIRETY COULD RESULT IN EXTREMELY HOT AIR LEAKING INTO DRIVE BAY AREA CAUSING MALFUNCTION OF UNIT AND DISTRESS TO SURROUNDING STRUCTURE, AND MAY LEAD TO AN INADVERTENT MOVEMENT OF THE BUCKETS TOWARDS THE REVERSE POSITION.

A. Preparation for Installation of the Rod Assemblies

NOTE: When adjusting the between-centres distance of the rod assemblies, use 6,35 mm (0.250 in) and 12,70 mm (0.500 in) diameter pin gauges.

- (1) Preparation of LH rod assembly (19-210) for assembly to bay 1.
 - (a) Fit locknut (19-270) to rod end (19-260).
 - (b) Screw the rod end assembly onto the fork end (19-280).
 - (c) Adjust the rod assembly between-centres distance to the nominal value of 101,10 mm (3.98 in) (dimension over pin gauges = 110,60 mm (4.35 in)).
 - (d) Tighten locknut (19-270) to the recommended torque.
 - (e) Fit flanged bushings (19-370) and (19-380) to the rod assembly, the bush shoulders being inside the yoke.
- (2) Preparation of LH rod assembly (29-290) for assembly to bay 3.
 - (a) Fit locknut (19-350) to rod end (19-340).
 - (b) Screw the rod end assembly onto the fork end (19-360).
 - (c) Adjust the rod assembly between-centres distance to the nominal values of 118,62 mm (4.89 in) (dimension over gauge pins = 128,12 mm (5.05 in)).
 - (d) Tighten locknut (19-350) to the recommended torque.
 - (e) Fit flanged bushings (19-370) and (19-380) to the rod assembly, the bush shoulders being inside the yoke.
- (3) Preparation of LH rod assembly (19-410) for assembly to bay 2 or 4.

sneema

- (a) Fit locknut (19-470) to rod end (19-460).
- (b) Screw the rod end assembly onto the fork end (19-480).
- (c) Adjust the rod assembly between-centres distance to the nominal value of 94,66 mm (3.313 in) (dimension over gauge pins = 104,56 mm (4.12 in)).
- (d) Tighten locknut (19-470) to the recommended torque.
- (e) Fit flange bushings (19-490) and (19-500) to the rod assembly, the bush shoulders being inside the yoke.

B. Preparation for Installation of the Bucket Drive Pneumatic Actuators.

NOTE: Before installing the pneumatic actuators, check that they are in the locked position (red lock visible).

- (1) Fit the appropriate rod assembly to each bucket drive pneumatic actuator (17-230).
i.e.: (19-210) for bay 1
 (19-290) for bay 3
 (19-410) for bays 2 and 4,
and secure them with bolts (17-270), plain washers (17-260) and castellated nuts (17-250).
- (2) Tighten the castellated nuts to the minimum recommended torque, and lock using split pin (17-240).
- (3) Fit flanged bushings (19-390) and (19-400) in the yoke end of the rod assemblies, the shoulder being inside the yoke (bay 1).
- (4) Fit flanged bushings (19-510) and (19-520) in the yoke end of the rod assemblies, the shoulder being inside the yoke (bay 2).
- (5) Fit flanged bushings (17-370) and (17-380) in the yoke end of the rod assemblies on the bay 1 pneumatic actuator, then the bushings (17-390) and (17-400) in the yoke end of the bay 2 pneumatic actuator.

C. Installation of the Bay 2/4 Bucket Drive Pneumatic Actuator

- (1) Place the pneumatic actuator (17-230) in its bay slightly tilted towards the centre of the twin secondary nozzle. Introduce it slowly. Position the rod assembly in the suspension yoke.
- (2) Position the actuator boss in the yoke on the structure and fit bolt (17-350) complete with plain washer (17-360). The head of the bolt is to be towards the inside of the actuator housing.
- (3) Position the rear boss on the drive actuator in the yoke on the structure and fit bolt (17-310) complete with bushing (17-320), the head of the bolt being rearwards.
- (4) Fit the rod assembly in the yoke, using a bolt (19-450) the head being rearwards.
- (5) Fit washer (19-440) and castellated nut (19-430) without tightening.
- (6) Fit washer (17-300) and castellated nut (17-290).
- (7) Fit castellated nut (17-340).
- (8) Tighten castellated nut (17-290) and then (17-340) to the minimum recommended torques. Lock using split pins (17-280) and (17-330).
- (9) Install the telescopic tube (17-10)

CAUTION: THE NON-APPLICATION OF THIS DRILL WOULD PROBABLY LEAD TO AN INADVERTENT MOVEMENT OF THE BUCKETS TOWARDS THE REVERSE POSITION.

CAUTION: INTRODUCTION OF ANY ANTI-SEIZE OR LUBRICATING PRODUCT IS STRICTLY FORBIDDEN. SEND THE TELESCOPIC TUBE TO SHOP FOR MAINTENANCE WHEN FOUND STIFF TO MOVE DURING GROUND MAINTENANCE.

- (a) Ensure Telescopic Tube is installed the correct way round (Ref. Fig. 513 Sheet 2 of 2).
- (b) Ensure foolproof ring is present on telescopic tube.
- (c) Engage lip of spherical seal at large diameter end with the retaining plate (17-50). Check lip has engaged by giving tube a sharp pull away from plate.

78-13-01

OLYMPUS 593
MK. 610-14-28
OVERHAUL

- (d) If retaining plate has been removed do not tighten retaining bolt (17-30) until Telescopic Tube is fully engaged on the spherical seal.
 - (10) Fit elbow assembly (17-170) to the actuator, with a new sealing ring (17-180) and secure it by collar clamp (17-160) without tightening.
 - (11) Engage the inner cylinder of the telescopic tube in the telescopic tube keep ring (17-90) installed on the P3 air supply elbow.
 - (12) Align pipe assembly (19-200) and elbow assembly (17-170) for installation of the telescopic tube (17-10).
 - (a) Set the alignment by rotating elbow assembly (17-170) and, if necessary, by changing the length of the rod assembly.
 - (b) Tighten the collar clamp (17-160) to the recommended torque.
 - (c) Check the clearance between the pneumatic actuator and the structure (min. 6,35 mm (0.25 in)).
- NOTE: If the length of the rod assembly has been changed, do not omit to retighten nut (19-470) to the recommended torque.
- (d) Wire lock nut (19-470).
 - (e) Tighten the castellated nut (19-430) to the minimum recommended torque, and lock it using split pin (19-420).
 - (f) Apply a coat of elastomer RTV 3145 (P678) to the castellated nut (19-430) and the end of bolt (19-450):
 - 1 Clean the surfaces to be coated using isopropyl alcohol (P442).
 - 2 Apply a coat of primer (P594) with a brush to the degreased surfaces. Leave to dry for 30 minutes at ambient temperature.
 - 3 Prepare the required quantity of elastomer RTV 3175 (P678). Using a spatula, mix this product with additive 4812A (P546) in the proportion of 3%.
 - 4 Apply a coat of elastomer RTV 3145 with a spatula to the castellated nut and the end of the bolt.
- After drying, apply a second coat of elastomer.

OVERHAUL

sneema

- 5 Leave the elastomer to polymerize for a minimum of 24 hours at ambient temperature and in contact with air moisture.

- (13) Installation of the pneumatic actuator exhaust elbow assembly (17-210).
- (a) Fit studs (17-220) to the pneumatic actuator (17-230).
 - (b) Tighten the studs to the recommended torque and wire lock them.
 - (c) Locate the exhaust elbow assembly (17-210) to the pneumatic actuator.
 - (d) Secure the exhaust elbow assembly using flat washers (17-200) and self-locking nuts (17-190).
 - (e) Tighten the nuts to the recommended torques.

D. Installation of the Bay 1/3 Bucket Drive Pneumatic Actuator

- (1) Place the pneumatic actuator (17-230) in its bay slightly tilted towards the centre of the twin secondary nozzle. Introduce it slowly. Position the rod assembly in the suspension yoke.
- (2) Position the actuator boss in the yoke on the structure and fit bolt (17-350) complete with plain washer (17-360). The head of the bolt is to be towards the inside of the actuator housing.
- (3) Position the rear boss on the drive actuator in the yoke on the structure and fit bolt (17-310) complete with bushing (17-320), the head of the bolt being rearwards.
- (4) Fit the rod assembly in the yoke, using a bolt (19-450) the head being rearwards.
- (5) Fit washer (19-440) and castellated nut (19-430) without tightening.
- (6) Fit washer (17-300) and castellated nut (17-290).
- (7) Fit castellated nut (17-340).
- (8) Tighten castellated nut (17-290) and then (17-340) to the minimum recommended torques. Lock using split pins (17-280) and (17-330).

OVERHAUL

snecma

(9) Install the telescopic tube (17-10)

CAUTION: THE NON-APPLICATION OF THIS DRILL WOULD PROBABLY LEAD TO AN INADVERTENT MOVEMENT OF THE BUCKETS TOWARDS THE REVERSE POSITION.

CAUTION: INTRODUCTION OF ANY ANTI-SEIZE OR LUBRICATING PRODUCT IS STRICTLY FORBIDDEN SEND THE TELESCOPIC TUBE TO SHOP FOR MAINTENANCE WHEN FOUND STIFF TO MOVE DURING GROUND MAINTENANCE.

- (a) Ensure Telescopic Tube is installed the correct way round (Ref. Fig. 513 Sheet 2 of 2).
 - (b) Ensure foolproof ring is present on telescopic tube.
 - (c) Engage lip of spherical seal at large diameter end with the retaining plate (17-50). Check lip has engaged by giving tube a sharp pull away from plate.
 - (d) If retaining plate has been removed do not tighten retaining bolt (17-30) until Telescopic Tube is fully engaged on the spherical seal.
- (10) Fit elbow assembly (17-170) to the actuator, with a new sealing ring (17-180) and secure it by collar clamp (17-160) without tightening.
- (11) Engage the inner cylinder of the telescopic tube in the telescopic tube keep ring (17-90) installed on the P3 air supply elbow.
- (12) Align pipe assembly (19-200) and elbow assembly (17-170) for installation of the telescopic tube (17-10).
- (a) Set the alignment by rotating elbow assembly (17-170) and, if necessary, by changing the length of the rod assembly.
 - (b) Tighten the collar clamp (17-160) to the recommended torque.
 - (c) Check the clearance between the pneumatic actuator and the structure (min. 6,35 mm (0.25 in)).
- NOTE: If the length of the rod assembly has been changed, do not omit to retighten nut (19-470) to the recommended torque.
- (d) Wire lock nut (19-470).

78-13-01

- (e) Tighten the castellated nut (19-430) to the minimum recommended torque, and lock it using split pin (19-420).
- (f) Apply a coat of elastomer RTV 3145 (P678) to the castellated nut (19-430) and the end of bolt (19-450):
 - 1 Clean the surfaces to be coated using isopropyl alcohol (P442).
 - 2 Apply a coat of primer (P594) with a brush to the degreased surfaces. Leave to dry for 30 minutes at ambient temperature.
 - 3 Prepare the required quantity of elastomer RTV 3175 (P678). Using a spatula, mix this product with additive 4812A (P546) in the proportion of 3%.
 - 4 Apply a coat of elastomer RTV 3145 with a spatula to the castellated nut and the end of the bolt.
After drying, apply a second coat of elastomer.
 - 5 Leave the elastomer to polymerize for a minimum of 24 hours at ambient temperature and in contact with air moisture.
- (13) Installation of the pneumatic actuator exhaust elbow assembly (17-210).
 - (a) Fit studs (17-220) to the pneumatic actuator (17-230).
 - (b) Tighten the studs to the recommended torque and wire lock them.
 - (c) Locate the exhaust elbow assembly (17-210) to the pneumatic actuator.
 - (d) Secure the exhaust elbow assembly using flat washers (17-200) and self-locking nuts (17-190).
 - (e) Tighten the nuts to the recommended torques.

OVERHAUL

- E. Secure the Flexible Shaft (15-20) to the Bucket Pneumatic Drive Actuator or Bay 1 or 3 (Figure 511).
- (1) Remove the shaft support - tool SC 187 - fitted on the end of the flexible shaft (15-20).
 - (2) Insert hexagon 2 of the flexible shaft in the bucket pneumatic drive actuator, rotating it plus or minus 30 degrees using spanner - tool SC 249.
 - (3) Measure the clearance between the collar and the bucket pneumatic drive actuator:
 - if the clearance is less than 3 mm (0.118 in), secure the flange to the bucket pneumatic drive actuator using bolts (15-22),
 - if the clearance lies between 3 and 5 mm (0.118 and 0.197 in), insert a 4 mm (0.157 in) shim (15-25) between the flange and the pneumatic drive actuator and secure the assembly using bolts (15-23),
 - if the clearance is greater than 5 mm (0.197 in), insert a 6 mm (0.236 in) shim (15-26) between the flange and the bucket pneumatic drive actuator and secure the assembly using bolts (15-24).
- F. Secure the Flexible shaft (15-10) to the Bucket Pneumatic Drive Actuator of Bay 1 or 3 (Figure 511)
- (1) Remove the shaft support - tool SC 187 - fitted on the end of the flexible shaft (15-10).
 - (2) Insert hexagon (2) of the flexible shaft into the bucket pneumatic drive actuator, rotating it clockwise sixty degrees (looking in from the end of the flexible shaft) using spanner - tool SC 249.
 - (3) Measure the clearance between the collar and the bucket pneumatic drive actuator:
 - if the clearance is less than 3 mm (0.118 in), position the open flange and secure it using bolts (15-12),
 - if the clearance lies between 3 and 5 mm (0.118 and 0.197 in), insert a 4 mm (0.157 in) shim (15-15) between the open flange and the bucket pneumatic drive actuator and secure the assembly using bolts (15-13),

(3) Measure the clearance between the collar and the bucket pneumatic drive actuator:

- if the clearance is less than 3 mm (0.118 in.), position the open flange and secure it using bolts (15-162),
- if the clearance lies between 3 and 5 mm (0.118 and 0.197 in.), insert a 4 mm (0.157 in.) shim (15-165) between the open flange and the bucket pneumatic drive actuator and secure the assembly using bolts (15-163),
- if the clearance is greater than 5 mm (0.197 in.), insert a 6 mm (0.236 in.) shim (15-166) between the open flange and the bucket pneumatic drive actuator and secure the assembly using bolts (15-164).

H. Secure the Flexible Shaft (15-150) on the Bucket Pneumatic Drive Actuator of Bay 2 or 4 (Figure 511).

- (1) Remove the shaft support - tool SC 187 - fitted on the end of the flexible shaft (15-150).
- (2) Insert hexagon (2) of the flexible shaft into the bucket pneumatic drive actuator, rotating it anti-clockwise sixty degrees maximum (looking in from the end of the flexible shaft) using spanner - tool SC 249.
- (3) Measure the clearance between the collar and the bucket pneumatic drive actuator:
 - if the clearance is less than 3 mm (0.118 in.) secure the flexible shaft flange to the bucket pneumatic drive actuator using bolts (15-152).
 - if the clearance lies between 3 and 5 mm (0.118 and 0.197 in.), insert a 4 mm (0.157 in.) shim (15-155) between the flexible shaft flange and the bucket pneumatic drive actuator and secure the assembly using bolts (15-153),
 - if the clearance is greater than 5 mm (0.197 in.), insert a 6 mm (0.235 in.) shim (15-156) between the flexible shaft flange and the bucket pneumatic drive actuator and secure the assembly using bolts (15-154).

J. Connection of Electrical Wiring Harness to the Bucket Drive Pneumatic Actuators.

Carry out the following operations for each pneumatic actuator:

78-13-01

**OLYMPUS 593****MK. 610-14-28****OVERHAUL****SNECMA**

- (1) Remove the blanking caps fitted to the actuator receptacles and the wiring connectors.
- (2) Connect wiring harness connector C to the pneumatic actuator receptacle, tighten the nut to the recommended torque and wire lock.
- (3) Connect wiring harness connector D to the pneumatic actuator, tighten the nut to the recommended torque and wire lock.
- (4) Connect the wiring harness connector E to the pneumatic actuator, tighten the nut to the recommended torque and wire lock.

22A. Installation of Mounting Pin Assembly

A. Installation of Mounting Pin Assembly.

- (1) Deleted.
- (2) Deleted.
- (3) Position the pin assembly thus formed in its housing in the upper part of bay 1 of the twin secondary nozzle assembly.
- (4) Position cup washer (8-100).
- (5) Fit spherical stop (8-90) to the dogged washer (8-80).
- (6) Fit the dogged washer/spherical stop assembly to the structure and lock the dogged washer.
- (7) Using a spanner, move the spherical stop to bring it into contact with the cup washer. Lock to the recommended torque.
- (8) Fit the lock plate (8-70).
- (9) Lock the plate using split pin (8-60).
- (10) Fit spacer (8-50) and secure it with countersunk head screw (8-40).
- (11) Tighten the screw (8-40) to the recommended torque.
- (12) Secure the cover (8-30) to the spacer, using countersunk head screws (8-20).

- (3) Position the pin assembly thus formed in its housing in the lower part of bay 2 of the twin secondary nozzle assembly.
- (4) Position the cup washer (8-490).
- (5) Fit spherical stop (8-480) to the dogged washer (8-470).
- (6) Fit the dogged washer/spherical stop assembly to the structure and lock the dogged washer.
- (7) Using a spanner, move the spherical stop to bring it into contact with the cup washer. Lock to the recommended torque.
- (8) Fit the lock plate (8-460).
- (9) Lock the plate using split pin (8-450).
- (10) Fit spacer (8-440) and secure it with countersunk head screw (8-430).
- (11) Tighten the screw (8-430) to the recommended torque.
- (12) Secure the cover (8-420) to the spacer, using countersunk head screws (8-410).
- (13) Tighten countersunk head screws (8-410) to the recommended torques.

NOTE: Installation of mounting pin (8-400) for bay 3 is identical to that described above, but uses spacer (8-441) and cover (8-421).

E. Installation of Mounting Pin Assembly (8-530).

NOTE: The installation of mounting pin assemblies (8-530) is described in this chapter, but is only to be carried out when the secondary nozzle assembly is fitted to the aircraft. The mounting pin assemblies should be packed and accompany the secondary nozzle assembly.

Carry out the following operations for each pin assembly:

- (1) Deleted.

78-13-01

OLYMPUS 593

MK. 610-14-28

OVERHAUL

- (2) Deleted.
- (3) Position the pin assembly thus formed in its housing in the side part of bay 1, 2, 3 or 4 of the twin secondary nozzle assembly.
- (4) Position the cup washer (8-600).
- (5) Fit spherical stop (8-590) to the dogged washer (8-580).
- (6) Fit the dogged washer/spherical stop assembly to the structure and lock the dogged washer.
- (7) Using a spanner, move the spherical stop to bring it into contact with the cup washer. Lock to the recommended torque.
- (8) Fit the lock plate (8-570).
- (9) Lock the plate using split pin (8-560).
- (10) Fit spacer (8-550) and secure it with countersunk head screw (8-540).
- (11) Tighten the screw (8-540) to the recommended torque.

23. Installation of Reverser Bucket Assemblies to the Structure

- A. Operate the Rotating Stand - tool SC 117 - to bring twin secondary nozzle assembly into the horizontal position.
- B. Installation of the trunnion locking pins (Figure 515).
 - (1) Secure the trunnion locking pins (2-380) into the bores which house the upper trunnions on the side walls.

Carry out the following operations for each attachment point:

- (a) Fit the trunnion locking pins (2-380) by introducing them into their housing from inside the bore which houses the trunnion.
- (b) Fit plain washers (2-370) and nuts (2-360), without tightening.
- (c) Fit the bucket trunnion bearing (2-350) and move the locking pins (2-380) such that the flats on their heads fall within the trunnion bearing slots.

78-13-01

OVERHAUL

- (d) Tighten nuts (2-360) to the recommended torques.
 - (e) Wire lock the trunnion locking pins (2-380) and withdraw the trunnion bearing.
- (2) Installation of the trunnion locking pins (2-200) into the bores which house the upper and lower bucket trunnion bearings on the central wall.

Carry out the following operations for each attachment point :

- (a) Fit the trunnion locking pin (2-200) by inserting it into its housing from inside the bore which houses the trunnion bearing.
 - (b) Fit plain washer (2-190) and nut (2-180) without tightening.
 - (c) Fit the bucket trunnion bearing (2-160) or (2-170) and move the locking pin (2-200), such that the flats on its head lie within the slot on the trunnion bearing.
 - (d) Tighten nut (2-180) to the recommended torque.
 - (e) Lock the locking pin (2-200) to the adjacent pin and withdraw the trunnion bearing.
- (3) Installation of trunnion locking pins (2-290) into the bores which house the lower bucket trunnion bearing on the side walls.

Carry out the following operations for each attachment point :

- (a) Fit the trunnion locking pins (2-290) by inserting them into their housing from inside the bore which houses the trunnion bearing.
- (b) Fit washers (2-280) and nuts (2-270), without tightening.
- (c) Fit the bucket trunnion bearing (2-260) and move the locking pins (2-290) such that the flats on their heads lie in the slots on the trunnion bearing.
- (d) Tighten nuts (2-270) to the recommended torques.
- (e) Wire lock the locking pins (2-290) and withdraw the trunnion bearing.

C. Installation of the Safety Pin Locking Pads

Carry out the following operations for each attachment point :

- (1) Fit the double ended bolts (2-140) complete with adjusting shims (2-150) to the central wall brackets.
- (2) On each double ended bolt, fit the two locking pads (2-120), taking care to position them as follows :
 - (a) The first locking pad is positioned with its boss turned towards the operator.
 - (b) The second locking pad is positioned with its boss turned towards the structure.
- (3) Fit the plain washer (2-100) and the castellated nut (2-90).
- (4) Tighten the castellated nut to the minimum recommended torque and lock it using split pin (2-80).

D. Preparation for Adjustment of the Reverser Buckets

- (1) Unlock the bucket drive pneumatic actuators (see fig. 513).
- (2) Withdraw the blank from the reduction gearbox on a ballscrew gearbox and, using adaptor - tool SC 203 - turn the ballscrew gearbox driving shaft two turns towards the reverse jet position.
- (3) Lock the pneumatic actuator (see fig. 513).
- (4) Carry out the same operation on the other bay.

E. Installation of the Bay 1 Upper Reverser Bucket

- (1) With the reverser bucket assembly (2-10) on the workstand - tool SC 37 - position the hoisting bea - tool SC 205 - using a hoist, and secure it to th bucket assembly.
- (2) Free the reverser bucket assembly on the workstand and, by operating the hoist, position the bucket assembly on the structure.
- (3) Remove the brass wires which secure the bay 1 upper ballscrew gearboxes and the polyurethane foam.
- (4) Position the bucket assembly and fit the bucket trunnion bearing (2-170) on the central wall side, and (2-260) on the side wall.

OLYMPUS 593

MK.610-14-28

OVERHAUL

- (5) Fit the trunnion bearing attachment bolt (2-340), inserting it from outside the structure.
- (6) Fit the trunnion attachment bolt washer (2-330) and self-locking nut (2-320).
- (7) Tighten the nut (2-320) to the recommended torque using the special spanner - tool SC 254.
- (8) Fit the anti-rotation sleeve (2-310), its skirt bearing against self-locking nut (2-320).
- (9) Fit locknut (2-300) and tighten to the recommended torque, using the special spanner - tool SC 254.
- (10) Fit the safety pin (2-130) to restrain the bucket trunnion bearing (2-170), the flat on the pin head being in contact with a flat on the double ended bolt (2-140).
- (11) Secure the safety pin to the locking pad (2-120) using bolt (2-110).
- (12) Tighten bolt (2-110) to the recommended torque.
- (13) Unlock the locknut (figure 516) on the spherical joint end fitting of the upper ballscrew gearboxes in bay 1. Using special spanner - tool SC 263 - slacken the locknut.
- (14) Bring the leading edge of the reverser bucket into contact with the heat shield seal.

CAUTION : THE SEAL MUST NOT BE COMPRESSED.

- (15) Unscrew the ballscrew gearbox end fitting, a half-a- turn at a time, until the ballscrew gearbox may be pinned to the reverser bucket using pin - tool SC 39 - in line with the limits given below.
 - (a) If the ballscrew gearbox end fitting pin is upstream of the reverser bucket bracket centre line (area A, figure 516), unscrew the ballscrew gearbox end fitting by a half-a-turn before pinning.
 - (b) If the ballscrew gearbox end fitting pin is downstream of the reverser bucket bracket centre line (area B, figure 516), carry out pinning.
- (16) Measure the maximum clearance which exists between then seal and the leading edge of the bucket.
 - (a) If the clearance is less than 2,5 mm (0.1 in.) the setting is correct.

78-13-01

Page 591
Oct 31/81

OLYMPUS 593

MK.610-14-28

OVERHAUL

(b) If the clearance is more than 2,5 mm (0.1 in.), screw in the ballscrew gearbox end fittings by half-a-turn, and pin.

(17) Using the special spanner - tool SC 263 - tighten the ballscrew gearbox spherical end fitting locknuts and check that the key is in place. Wire lock the locknut.

F. Installation of the Bay 1 Lower Reverser Bucket Assembly

- (1) With the bucket assembly (2-10) on the workstand - tool SC 37 - position the hoisting beam - tool SC 205 - using a hoist, and secure it to the bucket assembly.
- (2) Free the bucket assembly from the workstand and, by operating the hoist, position the reverser bucket to the structure.
- (3) Withdraw the brass wires which secure the bay 1 lower ballscrew gearboxes, and the polyurethane foam.
- (4) Position the bucket assembly and fit the bucket trunnion bearing (2-160) on the central wall side, and (2-350) on the side wall.
- (5) Fit the trunnion bearing attachment bolt (2-250), inserting it from the outside of the structure.
- (6) Fit the trunnion attachment bolt washer (2-240) and self-locking nut (2-230).
- (7) Tighten the nut (2-230) to the recommended torque, using the special spanner - tool SC 254.
- (8) Fit the anti-rotation sleeve (2-220), the skirt bearing against the nut (2-230).
- (9) Fit locknut (2-210) and tighten to the recommended torque, using special spanner - tool SC 254.
- (10) Fit safety pin (2-130) to restrain the bucket trunnion bearing (2-160), the flat of the head on the safety pin being in contact with a flat of the double ended bolt (2-140).
- (11) Secure the safety pin to the locking pad (2-120), using bolt (2-110).
- (12) Tighten bolt (2-110) to the recommended torque.

OLYMPUS 593

MK.610-14-28

OVERHAUL

- (13) Slacken the locknut (Figure 516) of the bay 1 lower ballscrew gearbox end fitting, and using special spanner - tool SC 263 - slacken the locknut.
- (14) Repeat operations (14), (15), (16), (17) of preceding paragraph E.

G. Installation of the Bay 2 Upper Reverser Bucket Assembly

- (1) With the reverser bucket assembly (2-10) on the workstand - tool SC 37 - position the hoisting beam - tool SC 205 - using a hoist, and secure it to the bucket assembly.
- (2) Free the bucket assembly from the workstand, and operate the hoist to position the bucket assembly on the structure.
- (3) Withdraw the brass wires which secure the bay 2 upper ballscrew gearboxes and the polyurethane foam.
- (4) Position the bucket assembly and fit bucket trunnion bearing (2-160) on the central wall side and (2-350) on the side wall.
- (5) Fit the trunnion bucket attachment bolt (2-340) by inserting it from the outside of the structure.
- (6) Fit the trunnion attachment bolt washer (2-330) and self-locking nut (2-320).
- (7) Tighten the nut (2-320) to the recommended torque, using the special spanner - tool SC 254.
- (8) Fit the anti-rotation sleeve (2-310), the skirt bearing against nut (2-320).
- (9) Fit the locknut (2-300) and tighten it to the recommended torque, using special spanner - tool SC 254.
- (10) Fit the safety pin (2-130) to restrain the bucket trunnion bearing (2-160), the flat on the head of the pin being in contact with a flat on the double ended bolt (2-140).
- (11) Secure the safety pin to the locking pad (2-120), using bolt (2-110).
- (12) Tighten bolt (2-110) to the recommended torque.

OLYMPUS 593

MK.610-14-28

OVERHAUL

- (13) Wire lock both bolts (2-110) (see figure 515).
- (14) Fit the trunnion attachment bolt (2-60) complete with its washer (2-70), inserting it from bay 1.
- (15) Fit the trunnion attachment bolt washer (2-50) and self-locking nut (2-40).
- (16) Tighten the nut (2-40) to the recommended torque, using the special spanner - tool SC 254.
- (17) Fit the anti-rotation sleeve (2-30), the skirt bearing against the nut (2-40).
- (18) Fit the locknut (2-20) and tighten it to the recommended torque, using the special spanner - tool SC 254.
- (19) Unlock the locknut (figure 516) on the bay 2 lower ball screw gearbox end fitting and, using the special spanner - tool SC 263 - slacken the locknut.
- (20) Repeat the operations (14), (15), (16), (17) of preceding paragraph E.

H. Installation of the Bay 2 Lower Reverser Bucket Assembly

- (1) With the bucket assembly (2-10) on the workstand - tool SC 37 - position the hoisting beam - tool SC 205 - using a hoist, and secure it to the bucket assembly.
- (2) Free the bucket assembly from the workstand and, by operating the hoist, position the bucket assembly to the structure.
- (3) Withdraw the brass wires which secure the bay 2 lower ballscrew gearboxes and the polyurethane foam.
- (4) Position the bucket assembly and fit the bucket trunnion bearing (2-170) on the central wall side, and (2-260) on the side wall.
- (5) Fit the trunnion bearing attachment bolt (2-250), inserting it from outside the structure.
- (6) Fit the trunnion attachment bolt washer (2-240) and self-locking nut (2-230).
- (7) Tighten the nut (2-230) to the recommended torque, using the special spanner - tool SC 254.

OVERHAUL

- (8) Fit the anti-rotation sleeve (2-220), the skirt bearing against the nut (2-230).
- (9) Fit the locknut (2-210) and tighten it to the recommended torque using special spanner - tool SC 254.
- (10) Fit the safety pin (2-130) to restrain the trunnio bucket bearing (2-170), the flat on the head of the pin being in contact with a flat of the double ended bolt (2-140).
- (11) Secure the safety pin to the locking pad (2-120) using bolt (2-110).
- (12) Tighten the bolt (2-110) to the recommended torque.
- (13) Wire lock the two bolts (2-110) (see figure 515).
- (14) Fit the trunnion attachment bolt (2-60), complete with its washer (2-70), inserting it from bay 1.
- (15) Fit trunnion attachment bolt washer (2-50) and self-locking nut (2-40).
- (16) Tighten the nut (2-40) to the recommended torque, using the special spanner - tool SC 254.
- (17) Fit the anti-rotation sleeve (2-30), the skirt bearing against the nut (2-40).
- (18) Fit the locknut (2-20) and tighten it to the recommended torque, using the special spanner - tool SC 254.
- (19) Unlock the locknut (figure 516) on the bay 2 lower ballscrew gearbox spherical bearing end fitting, and using special spanner - tool SC 263 - slacken the locknut.
- (20) Repeat the operating (14), (15), (16), (17) of preceding paragraph E.

J. Installation of the Ballscrew Gearbox Attachment Bolt

- (1) Unlock the bucket drive pneumatic actuators (see fig. 513).
- (2) Using a drill fitted with the adaptor - tool SC 203 - turn the reduction gearbox drive shaft on a ballscrew gearbox until the reverser buckets on the bay are in the 45° position approximately.
- (3) Carry out the following operations for each ballscrew gearbox/reverser bucket link :

78-13-01

Page 595

Oct 31/81

OLYMPUS 593

MK.610-14-28
OVERHAUL

- (a) Withdraw the provisional pin - tool SC 39.
 - (b) Check that the bushes are correctly located in the bucket yoke (figure 516).
 - (c) Fit the ballscrew gearbox attachment bolt (2-420) complete with plain washer (2-430).
 - (d) Fit plain washer (2-410) and castellated nut (2-400).
 - (e) Tighten the nut to the recommended torque and lock it using split pin (2-390).
- (4) Using an electric drill fitted with the adaptor - tool SC 203 - drive the buckets into the reverse check position.
 - (5) Check the clearance between the trailing edges of the two reverser bucket primary heat shields. This clearance must be 8 ± 6 mm ($.31496 \pm .23622$ in.).
 - (6) Return the buckets to the 0° position and check that the structure which carries the seal and the bucket structure do not interfere. If interference occurs, unscrew the ballscrew gearbox end-piece a maximum of one-half turn.
 - (7) Lock the bucket drive pneumatic actuators (see fig.513)

24. Installation of Deflector Assemblies

A. Installation of Deflector Assembly (1-10)

- (1) Check that all the assembly elements are correctly positioned on the template - tool SC 200.
- (2) Fit the deflector assembly (1-10) to the reverser bucket assembly.
- (3) Fit bolts (1-140), complete with plain washers (1-150) without tightening.
- (4) Fit bolt (1-160) complete with plain washer (1-170), without tightening.
- (5) Fit the cover strip (1-100).
- (6) Fit bolts (1-60), complete with plain washers (1-70), bolt (1-80), complete with plain washer (1-90).

OLYMPUS 593

MK.610-14-28

OVERHAUL

- (7) Fit bolt (1-20), complete with plain washers (1-30) and (1-50) and self-locking nut (1-40).
- (8) Fit bolts (1-180), complete with plain washers (1-190).
- (9) Fit bolts (1-110), (1-120) and (1-130).
- (10) Tighten the assembly elements to the recommended torques.

B. Installation of Deflector Assembly (1-200)

- (1) Check that all the assembly elements are correctly positioned on the template - tool SC 200.
- (2) Fit the deflector assembly (1-200) to the reverse bucket assembly.
- (3) Fit bolts (1-330), complete with plain washers (1-340), without tightening.
- (4) Fit bolt (1-350), complete with plain washer (1-360), without tightening.
- (5) Fit the cover strip (1-290).
- (6) Fit bolts (1-250), complete with plain washers (1-260), bolt (1-270) complete with plain washer (1-280).
- (7) Fit bolt (1-210), complete the plain washer (1-220), plain washer (1-240) and self-locking nut (1-230).
- (8) Fit bolts (1-370), complete with plain washers (1-380).
- (9) Fit bolts (1-300), (1-310) and (1-320).
- (10) Tighten the assembly elements to the recommended torques.

25. Fitting out of the Front Framework

NOTE : The operations for equipping the front framework are described in this chapter, since it is an assembly operation. However, they should only be carried out after testing, when the secondary nozzle assembly is on the transport trolley - tool SC 36.

OLYMPUS 593

OVERHAUL

A. Installation of the Seal Plates Around the Bay 1 Front Framework

- (1) Fit seal plate (10-240) and secure it using countersunk head screws (10-230) and nuts (10-245).
- (2) Fit seal plate (10-220) and secure it with countersunk head screws (10-210) and nuts (10-225).
- (3) Fit seal plate (10-200) and secure it with countersunk head screws (10-190) and nuts (10-205).
- (4) Fit the seal plate (10-180) and secure it with countersunk head screws (10-170) and nuts (10-185).
- (5) Fit the seal plate (10-160) and secure it with the countersunk head screws (10-150) and nuts (10-165).
- (6) Fit the seal plate (10-140) and secure it with the countersunk head screws (10-130) and nuts (10-145).
- (7) Fit the seal plate (10-120) and secure it with the countersunk head screws (10-110) and nuts (10-125).
- (8) Fit the seal plate (10-100) and secure it with the countersunk head screws (10-90) and nuts (10-105).
- (9) Fit the seal plate (10-80) and secure it with the countersunk head screws (10-70) and nuts (10-85).
- (10) Fit the seal plate (10-60) and secure it with the countersunk head screws (10-50) and nuts (10-65).
- (11) Fit the seal plate (10-40) and secure it with the countersunk head screws (10-30) and nuts (10-45).
- (12) Fit the seal plate (10-20) and secure it with :
 - (a) screws (10-17), washers (10-15) and nuts (10-12) ;
 - (b) screws (10-10) and nuts (10-5).
- (13) Tighten the screws to the recommended torques.

NOTE : Carry out the above operations for the following seal plates which are fitted to the RH twin secondary nozzle assembly : (10-221), (10-201), (10-181), (10-161), (10-141), (10-121), (10-101), (10-81), (10-61), (10-41), (10-21).

OVERHAUL

C. Installation of Anti-Fret Strips on the Central Wall

- (1) Position the anti-fret strips (10-520) and (10-530) and the throat washer (10-510).
- (2) Secure these elements with blind bolts (10-500).
- (3) Position the anti-fret strips (10-560) and (10-570) and the throat washer (10-550).
- (4) Secure these elements with blind bolts (10-540).
- (5) Position the anti-fret strips (10-600) and (10-610) and the throat washer (10-590).
- (6) Secure these elements with the blind bolts (10-580).
- (7) Position the anti-fret strips (10-640) and (10-650) and the throat washer (10-630).
- (8) Secure these elements with the blind bolts (10-620).
- (9) Position the anti-fret strips (10-690) and (10-700).
- (10) Secure the assembly using bolts (10-680), washers (10-670) and self-locking nuts (10-660).
- (11) Tighten the assembly elements to the recommended torques.

D. Installation of threaded pins (10-490)

- (1) Fit the threaded pins (10-490) to the lower front section of the central wall.
- (2) Tighten to the recommended torques and wire lock the pins.

E. Installation of the lateral trunnions

Carry out the following operations for each trunnion :

- (1) Fit the two spring pins (20-160) to the trunnion (20-170).
- (2) Fit the trunnion assembly thus formed into its support (20-150), the pins foremost.

78-13-01

Page 598.2

Apr 30/93

MK.610-14-28

OVERHAUL

PRINTED IN FRANCE

- (3) Position the trunnion support assembly on the structure.
- (4) Secure the support using countersunk head screws (20-90), plain washer (20-80) and self-locking nut (20-70).
- (5) Position the laminated shim (20-140) between the support and the structure.
- (6) Fit the bolt (20-120) complete with plain washer (20-130).
- (7) Fit the plain washer (20-110) and self-locking nut (20-100).
- (8) Tighten the nuts to the recommended torques.

f. Installation of the Lower Trunnion Assemblies

Carry out the following operations for each trunnion :

- (1) Fit the pivot bolt (29-20) to the trunnion bodge bolts (29-30).
- (2) Fit and tighten the nuts (29-10) to the recommended torques.

26. Sealing of the access doors to the bucket position transmitter (indicator)

This operation described hereafter is carried out systematically during the re-installation of the access doors to the bucket position transmitters (indicators).

A. Preparation of the surfaces (Figure 517)

- (1) Check that all the surfaces destined to receive the seal are entirely clean, otherwise clean as described in chapter "Cleaning" of this manual.
- (2) Using clean pliers, apply a coat of MB Primer (P475) on the area where the seal is to be located (areas A and B).

CAUTION : AVOID TOUCHING THE AREA COVERED WITH MB PRIMARY.

- (3) Spray a film of Luborflon (P541) on surface C of the secondary nozzle. Check to see that the Luborflon coating is even over the entire surface.

CAUTION : THE LUBORFLON SPRAY CAN MUST BE SHAKEN BEFORE USING.

78-13-01

Page 598.3
Apr 30/93

OLYMPUS 593

MK.610-14-28

OVERHAUL

- (4) Apply a film of oil on the bolts which secure the door to the nozzle to prevent the Rhodorsil from sticking to the threads.

B. Preparation of the Rhodorsil elastomer

- (1) Weigh 100 grams (3.527 oz.) of Rhodorsil CAF 4 THIXO (P474) and put it on a metal plate.
- (2) Weigh 4 grams (0.140 oz.) of additive 4812A (P546) and add to the elastomer.
- (3) Using a spatula, rapidly mix the two products thoroughly.

C. Application of the seal (Figure 518)

- (1) Using a spatula, apply the elastomer to area A, all around the door.

CAUTION : THIS OPERATION MUST BE CARRIED OUT AS FAST AS POSSIBLE BEFORE THE POLYMERIZATION OF THE ELASTOMER HINDERS HANDLING. DEPENDING ON THE AMBIENT TEMPERATURE, THE POLYMERIZATION MAY OCCUR VERY RAPIDLY.

- (2) Position two bolts at opposite corners of the door and fit the door on the nozzle using the two bolts.
- (3) Fit all the bolts and tighten to the specified torque.
- (4) Remove excess elastomer using a sharpened plexiglass blade (Figures 517 and 518).
- (5) Leave the elastomer to polymerize at least 24 hours.
- (6) After polymerization, remove the door. If necessary, use a sharpened light alloy blade to exert a force between the door and the nozzle.
- (7) Clean the bolts securing the door and remove the elastomer sticking to the threads.

OVERHAUL

D. Restoration of the Seal

NOTE: Following the removal of the door, flaws may appear in the quality of the seal. These are generally due to an improper distribution of elastomer on the door. It is possible to make up the lack of elastomer if it jeopardizes the quality of the seal by carrying out the following operations.

- (1) Clean the area to be reworked with acetone (P325) and avoid touching this cleaned area.
- (2) Make up the lack of elastomer using a tube of Rhodorsil. Additive 4812A (P546) is not required for this operation.
- (3) Use a spatula to even out the elastomer and remove excess Rhodorsil.
- (4) Leave to polymerize for at least one hour.

27. Installation of Access Doors (LH Twin Secondary Nozzle Assembly)

A. General

Installation of the access doors is described in this chapter, since it is an assembly operation. It should only be carried out, however, after the tests, when the twin secondary nozzle assembly is on the transport trolley-tool SC 36.

NOTE: These operations are the same for all the access doors except those on the bucket position transmitter (indicators). When installing a new access door, proceed as indicated in paragraph B below.

B. Preparation of a new door before installation (Refer to REP 29-190-26).

NOTE: This procedure is applicable to all the access doors with the exception of those to the bucket position transmitters (indicators).

- (1) Transfer the contour of the access door on a sheet of Stabilene tracing paper applied on the nozzle.
- (2) Place the Stabilene paper on the pre-machined replacement door and reproduce the above contour.
- (3) Cut out the replacement door to fit the contour using a rotary file mounted on a pneumatic tool.

78-13-01

OLYMPUS 593

MK.610-14-28

OVERHAUL

- (4) Deburr the door and smooth out lengthwise with an emery cloth.

NOTE : No crosswise marks allowable.

- (5) Position the door on the nozzle.
- (6) Check for correct cut out and clearances as shown on figure 519.
- (7) Install the door in accordance with the procedures and instructions given in paragraphs "Installation of Access Doors".

C. Installation of LH Access Door (3-10)

- (1) Position the sleeve assembly (3-130) to the sleeve support plate (3-120).
- (2) Fit the sleeve support assembly (3-140) to the door, on the internal face.
- (3) Secure the sleeve support plate/sleeve support assembly, using countersunk head screws (3-110), plain washers (3-100) and self-locking nuts (3-90).
- (4) Fit the sleeve assembly (3-70) to the sleeve support plate (3-60).
- (5) Position the sleeve support (3-80) to the door internal face.
- (6) Secure the sleeve support plate/sleeve support assembly, using countersunk head screws (3-50), plain washers (3-40) and self-locking nuts (3-30).
- (7) Tighten the nuts to the recommended torques.
- (8) Fit the door assembly thus formed to the bay 1 bucket pneumatic drive actuator, checking that the sleeves locate correctly into the actuator exhaust elbows.
- (9) Secure the access door using countersunk head screws (3-20).
- (10) Tighten the screws to the recommended torques.

D. Installation of LH Access Door (3-170)

- (1) Fit the access door (3-170) to the bay 2 bucket pneumatic drive actuator housing.

(2) Secure the door, using countersunk head screws (20-180).

(3) Tighten these screws to the recommended torques.

E. Installation of the LH Access Door (3-330)

(1) Position the access door (3-330) to the housing of the crossfeed isolation valve and the upper central ballscrew gearboxes.

(2) Secure the access doors using countersunk head screws (3-340).

(3) Tighten the screws to the recommended torques.

F. Installation of LH Access Door (3-350)

(1) Position the access door (3-350) to the bay 1 upper LH ballscrew gearbox housing.

(2) Secure the door using countersunk head screws (3-360).

(3) Tighten the screws to the recommended torques.

G. Installation of LH Access Door (3-370)

(1) Position the access door (3-370) to the bay 2 upper RH ballscrew gearbox housing.

(2) Secure the door using countersunk head screws (3-380).

(3) Tighten the screws to the recommended torques.

H. Installation of the RH Access Doors (3-390)

Carry out the following operations for each access door :

(1) Fit the countersunk head screw (3-410) to the cover plate (3-430).

(2) Screw the nut plate assembly (3-420) onto the screw (3-410).

(3) Fit the split pin (3-400).

(4) Fit the access door assembly into its housing on the structure and tighten the screw (3-410) to the recommended torque.

28. Installation of Access Doors (RH Twin Secondary Nozzle Assembly)

NOTE : The installation of the access doors is described in this chapter, since it is an assembly operation. However, it should only be carried out after the tests when the twin secondary nozzle assembly is on the transport trolley - tool SC 36.

A. Installation of RH Access Door (3-150)

- (1) Position the access door (3-150) to the housing of the bay 4 bucket drive pneumatic actuator.
- (2) Secure the door using countersunk head screws (3-160).
- (3) Tighten the screws to the recommended torques.

B. Installation of RH Access Door (3-190)

- (1) Position the sleeve assembly (3-310) on the sleeves support plate (3-300).
- (2) Fit the sleeve support assembly (3-320) to the door, on the internal face.
- (3) Secure the sleeve support plate/sleeve support assembly, using countersunk head screws (3-290), plain washers (3-280) and self-locking nuts (3-270).
- (4) Fit the sleeve assembly (3-250) to the sleeve support plate (3-240).
- (5) Position the sleeve support (3-260) to the door internal face.
- (6) Secure the sleeve support plate/sleeve support assembly, using countersunk head screws (3-230), plain washers (3-220) and self-locking nuts (3-210).
- (7) Tighten the nuts to the recommended torques.
- (8) Fit the door assembly thus formed to the bay 3 bucket pneumatic drive actuator, checking that the sleeves locate correctly into the actuator exhaust elbows.

C. Installation of RH Access Door (3-331)

(1) Position the access door (3-331) to the housing of crossfeed isolation valve and the upper central ballscrew gearboxes.

(2) Secure the door using countersunk head screws (3-340).

(3) Tighten the screws to the recommended torques.

D. Installation of RH Access Door (3-351)

(1) Position the access door (3-351) to the housing of the bay 4 lower RH ballscrew gearbox.

(2) Secure the door using countersunk head screws (3-360).

(3) Tighten the screws to the recommended torques.

E. Installation of RH Access Door (3-371).

(1) Position the access door (3-371) to the housing of the bay 3 upper LH ballscrew gearbox.

(2) Secure the door using countersunk head screws (3-380).

(3) Tighten the screws to the recommended torques.

F. Installation of Access Doors (3-390)

(1) Repeat the operations given in paragraph 25 F.

G. Installation of Access Doors (3-440)

(1) Repeat the operations given in paragraph 25 G.

H. Installation of RH Access Door (4-10)

(1) Repeat the operations given in paragraph 25 H.

OLYMPUS 593

MK.610-14-28
OVERHAUL

J. Installation of RH Access Door (4-31)

- (1) Position the access door (4-31) to the housing of the bay 4 lower RH ballscrew gearbox.
- (2) Secure the door using countersunk head screws (4-40).
- (3) Tighten the screws to the recommended torques.

K. Installation of RH Access Door (4-51)

- (1) Position the access door (4-51) to the housing of the bay 3 lower LH ballscrew gearbox.
- (2) Secure the door using countersunk head screws (4-60).
- (3) Tighten the screws to the recommended torques.

29. Installation of Access Doors to the Bucket Position Transmitter (Indicator) (LH and RH Twin Secondary Nozzle)

General

Installation of the access is described in this chapter, since it is an assembly operation.

It should only be carried out, however, after the tests, when the twin secondary nozzle assembly is on the transport trolley-tool SC 36.

NOTE : These operations are the same for the LH and RH access doors. When installing a new access door, proceed as indicated below.

A. Prepare to install a new door (4-70), (4-100), (4-71), (4-101)

- (1) Transfer the contour of the access door on a sheet of stabilene tracing paper applied on the nozzle.
- (2) Place the stabilene on the pre-machined replacement door and reproduce the above contour.
- (3) Cut out the replacement door to fit the contour using a rotary file mounted on a pneumatic tool.
- (4) Deburr the door and smooth out lengthwise with an emery cloth.

NOTE : No crosswise marks allowable.

OVERHAUL

- (5) Check for correct cut out ; rework if necessary.
- (6) Secure the replacement door to the nozzle structure using four (4) screws, one at each corner.
- (7) Locate the position of hole provided for the screws (4-90) or (4-120) and check the clearances (figure 519). If the screw (4-90) or (4-120) does not fit, carry out step (8) to (12) inclusive.
- (8) Machine out the insert 302-007-900-0 fitted to the door then rework as follows :
 - (a) If mismatch between the hole in the door and the one in the nozzle structure is less than 1,75 mm (0.07 in.); drill coaxially to the threaded hole of fitting (fig. 520).
 - (b) If mismatch is equal to 1,75 mm (0.07 in.) drill coaxially to the threaded hole of the fitting but tangentially to the offset hole.
 - (c) If mismatch is equal to 1,75 mm (0.07 in.) and is less than 3,5 mm (0.14 in.) do not drill coaxially to the threaded hole of fitting but tangentially to the offset hole.
- (9) Deburr hole using an emery cloth ; no radial marks allowable.
- (10) Position the replacement door on the structure to check for correct location of hole relative to the fitting.
- (11) Remove the door.
- (12) Crimp the insert 525-003-968-0 to the door.
- (13) Prepare the door for the application of a Rhodorsil seal as described in paragraph 26.
- (14) After the seal application, position the door on the structure.
- (15) Tighten the screws to the prescribed torques.

B. Installation of LH Access Door (4-70)

- (1) Fit the threaded plug (4-90) to the access door and tighten it to the recommended torque.
- (2) Position the access door to the housing of the bay 2 bucket position transmitter (indicator)

PRINTED IN FRANCE

OVERHAUL

(3) Secure the door using countersunk head screws (4-80).

(4) Tighten the screws to the recommended torques.

C. Installation of the LH Access Door (4-100)

(1) Fit the threaded plug (4-120) to the door and tighten it to the recommended torque.

(2) Position the access door to the housing of the bay 1 bucket position transmitter (indicator).

(3) Secure the door using countersunk head screws (4-110).

(4) Tighten the screws to the recommended torques.

D. Installation of RH Access Door (4-71)

(1) Fit the threaded plug (4-90) to the access door and tighten it to the recommended torque.

(2) Position the access door on the housing of the bay 3 nozzle position transmitter (indicator).

(3) Secure the door using countersunk head screws (4-80).

(4) Tighten the screws to the recommended torques.

E. Installation of RH Access Door (4-101)

(1) Fit the threaded plug (4-120) to the door and tighten it to the recommended torque.

(2) Position the access door on the housing of the bay 4 bucket position transmitter (indicator).

(3) Secure the door using countersunk head screws (4-110).

(4) Tighten the screws to the recommended torques.

30. Installation of Cover Assemblies (Figure 521)

A. Installation of Cover Assemblies (20-10)

(1) Position the cover assemblies (20-10) to the structure.

(2) Tighten the countersunk headscrew for each cover assembly to the recommended torque.

78-13-01

Page 598.17

OVERHAUL

B. Installation of Cover Assemblies (20-20)

- (1) Position the cover assemblies (20-20) to the structure.
- (2) Tighten the screws of each cover assembly to the recommended torques.

C. Installation of Cover Assemblies (20-180/190)

- (1) Position the cover assemblies (20-180/190) to the structure.
- (2) Tighten the screw of each cover assembly to the recommended torque.

31. Installation of the Twin Secondary Nozzle Assembly to the Transport Trolley

NOTE : Testing of the twin secondary nozzle assembly is to be carried out when it is installed on the rotating stand - tool SC 117. Installation to the transport trolley - tool SC 36 - should only be carried out after testing.

A. Fitting the Hoisting Beam - tool SC 195

- (1) Using a hoist, position the hoisting beam on the twin secondary nozzle assembly.
- (2) Secure the three strands of the hoisting beam to the secondary nozzle lifting points (upper handling point and lateral attachment points).
- (3) Take up the slack in the cables and free the twin secondary nozzle from the rotating stand.
- (4) Operate the handle on the hoisting beam to move the centre of gravity and balance the load.

B. Installation of the Twin secondary Nozzle Assembly onto the Transport Trolley

- (1) Operate the hoist to position the twin secondary nozzle assembly to the transport trolley - tool SC 36.
- (2) Fit the mounting elements at the rear side points and at the lateral primary nozzle mounting pin housings.
- (3) Remove the hoisting beam - tool SC 195.

OVERHAUL

**FITS AND CLEARANCES****1. General****A. Layout**

- (1) The table of clearances gives the machining tolerances of parts in new condition and acceptable wear limits. The values are expressed in millimeters.

ITEM FIG.	IPL FIGURE ITEM	NOMINAL DIMENSION	TYPE	CLEARANCES		MAX LIMIT	CAT.	REMARKS SELECTIONS
				MIN	MAX			
1	2	3	4	5	6	7	8	9

- (2) The item numbers in column (1) by reference to the corresponding figure provide a means of locating the clearance or dimension to be measured.
- (3) The item numbers in column (2) identify the parts in the "Illustrated Parts List". (FIGURE + ITEM).
- (4) Column (3) gives the manufacturing dimensions of parts together with the machining tolerances.
- In the case of two parts which form an assembly the first one is always the male part.
- (5) The code letters in column (4) indicate the type of clearance.
- A denotes an axial clearance
 - D denotes a diametral clearance
 - L denotes a side clearance
- (6) Columns (5) and (6) give the clearance (symbol J) or the interference (symbol S) which result from the manufacturing tolerances.
- Column (9) is used to indicate that a smaller clearance than that resulting from the manufacturing tolerances is required. This reduced clearance is obtained by selective assembly of parts.

78-13-01Page 601
Dec 30/74

OLYMPUS 593

MK.610-14-28

OVERHAUL

- (7) The digits or letter in column (8) give the clearance category the definition of which is as follows :

M - Check or adjustment to be carried out at each assembly

1 - Check to be systematically carried out.

2 - Check to be carried out if the condition of parts makes it necessary.

3 - Dimensions intended for use by Design Offices (not applicable in this document).

4 - Check to be systematically carried out on the equipments intended for ageing studies (Sampling).

B. Max. after wear (column 7)

(1) The MAX. LIMITS are the maximum wear limits within which a part can be accepted for a further period of use.

(2) Parts worn beyond these limits will be either repaired in accordance with the instructions given in chapter "REPAIR" or replaced as applicable.

(3) Therefore the values given in this column will change as experience is gained with the repaired equipment or the equipment intended for ageing studies.

(4) This kind of information may be entered in this column.

(a) Clearance

The maximum clearance or the minimum interference between two parts will be given only if they are matched parts. The distribution of this clearance on the male or female part is left to the discretion of the repairer.

(b) Dimension

In order to preserve interchangeability, the degree of permissible wear on male and female parts is given, thus ensuring a correct assembly at all times whatever the mating parts may be.

OVERHAUL

TESTING

1. General

The post-overhaul testing to be carried out the twin secondary nozzle assembly encompass the following separate tests/checks :

- A. Manual functional test of the reverse bucket system including measurement and recording of the drag torque loads and a check of the feedback signals in the various system operating modes.
- B. Functional test of the bucket system including a check of the bucket transit (travel) times.
- C. Functional test of the bucket system through actuation of the bucket crossfeed (crossbleed) isolation valve, also including a check of bucket transit times.
- D. Check of electrical continuity of the primary nozzle area transducer electrical harness.

2. Test Equipment Requirements

Perform testing on the twin secondary nozzle assembly after having it installed on rotating stand - tool SC 177 - .

A. Manual functional test

This test necessitates the use of :

- (1) One pneumatic power tool complete with a special adaptor - tool SC 203 -.
- (2) A test bench unit - tool SC 204 -.
- (3) Feed connection - tool SC 262 -.
- (4) One torque wrench (as an option, a torque wrench, model T.E.C. 3 FU, accurate to 2 % of the full scale and available from the STOKVIS Company) may be used.

B. Functional test of bucket system with check of transit times.

This test necessitates :

- (1) The test bench unit - tool SC 204 -.

78-13-01

OLYMPUS 593

MK.610-14-28
OVERHAUL

- NOTE : - The air supply for this test must allow a flow of 450 m³/hr. at a pressure of 3 bar. It must include a de-oiler, a de-hydrator, a 5 micron filter and a 0-6 bar pressure gauge with an accuracy of 1 %.
- The rig electrical supply shall be 220 Volts - 50 Hz.
- (2) One pneumatic power tool fitted with the adaptor
- tool SC 203 -.

C. Functional test of bucket system through actuation of the bucket crossfeed isolation valve

This test necessitates the same equipment as for the above functional test (refer to para. 2.B).

D. Electrical continuity check of the primary nozzle area transducer harness.

This check necessitates :

- (1) A 0.1 Ω to 0.5 K Ω ohmmeter; accuracy 0.01.

E. Testing sequence

Each bay being tested separately, the chronological order of the tests is as follows :

- (1) Manual functional test for bays 1 or 4.
- (2) Functional test associated with check of bucket transit times for bays 1 or 4.
- (3) Manual functional test for bays 2 or 3.
- (4) Functional test associated with check of bucket transit times for bays 2 or 3.
- (5) Functional test through actuation of bucket crossfeed isolation valve.
- (6) Electrical continuity check of primary nozzle area transducer electrical harness.

3. Manual Functional Test

A. Prepare for test

- (1) On the bucket pneumatic drive actuator, ensure that the reverse thrust manual lockout, is in the "unlocked" position (knurled knob disengaged). Ref. Fig. 701, detail A.
- (2) On the bucket pneumatic drive actuator, place the system manual lock and shipping lock, in the "unlocked" position. Ref. Fig. 701, detail B.
- (3) On the bucket position transmitter (indicator), place the manual lock in the "unlocked" (operating) position. Ref. Fig. 701, detail C.
- (4) On the upper central bucket ballscrew gearbox of the bay, remove access cover located on the reduction gearbox's housing - opposite to the input shafts - so as to enable installation of the transducer probe providing for count of the flexible shaft cores' numbers of revolutions.
- (5) On the upper lateral bucket ballscrew gearbox of same bay, remove access cover located on the reduction gearbox's housing - opposite to the input shafts - so as to enable installation of the pneumatic power tool used to actuate the flexible shafts, as well as the installation of the torque wrench used for measurement of the drag torques.
- (6) Locate the transducer probe in position and secure it with the two attaching bolts.
- (7) Remove the blanking parts from the appropriate boundary receptacles of electrical harnesses and plug in the mobile connectors of test bench unit - tool SC 204 -.

B. Test sequence

- (1) Before energizing the test bench unit, ensure that electrical circuits of the air inlet shut-off valve (ASOV) electro-magnetic control valve (torque motor) and crossfeed isolation valve, are open.
- (2) Energize the test bench unit. With the bucket system in the "straight through flow" configuration, ensure that :

OVERHAUL

- (a) the SW1, SW2 and SW4 lamps are OFF.
- (b) the SW3 and SW5 lamps are ON.
- (3) Measure the static drag torque. To this end, carry out the following :
- (a) Locate the torque wrench in position on the reduction gearbox.
- (b) Turn the torque wrench at a slow, constant speed (1 revolution per each 10 seconds) and perform five (5) full revolutions.
- (c) After completing the 5 revolutions, record the maximum torque load observed during the rotation.
Maximum torque : 1,95 N.m (17,5 lb.in.)
- (d) Repeat the above steps (b) and (c) turning, this time, in the opposite direction.
- (4) Using the pneumatic power tool, fitted with the adaptor - tool SC 203 -, actuate the bucket drive system up to 145 ± 5 RPM. Within these limits ensure that :
- (a) SW1 and SW2 lamps are OFF,
- (b) SW3 lamp goes OFF,
- (c) SW4 lamp goes ON,
- (d) SW5 lamp is ON.
- (5) Using the pneumatic power tool, actuate the drive system up to 260 RPM (bucket position $\gamma = 45$ deg.).
- (6) In this bucket position, measure the drag torque load as detailed in step (3).
- (7) Using the pneumatic power tool, actuate the drive system up to 264 ± 5 RPM. In the corresponding bucket position, check that :
- (a) SW1 lamp goes ON,
- (b) SW2 and SW3 lamps are OFF,
- (c) SW4 and SW5 lamps are ON.
- (8) Using the pneumatic power tool, actuate the system up to 417 RPM. In this bucket position, check that :

- PRINTED IN FRANCE
- (a) SW1 lamp is ON,
 - (b) SW2 lamp goes ON at 417 ± 1.25 RPM,
 - (c) SW3 lamp is OFF,
 - (d) SW4 lamp is ON,
 - (e) SW5 lamp goes OFF at 417 ± 2.5 RPM.
- (9) Using the pneumatic power tool, actuate the system up to 427 RPM (bucket position $\gamma = 73$ deg.). When reaching this position, ensure that :
- (a) SW1 and SW2 lamps are ON,
 - (b) SW3 lamp is OFF,
 - (c) SW4 lamp is ON,
 - (d) SW5 lamp is OFF.
- (10) In this position, which corresponds to the "reversed jet" configuration, check the gap between the respective trailing edge of the basic bucket structural frame-works. Ref. Fig. 702. This gap dimension is to be equal to : 8 ± 6 mm (0.07 to 0.55 in.)
- (11) In this "reversed jet" position, measure and record the drag torque load as detailed in step (3).
- (12) Using the pneumatic power tool, return the bucket to the "straight through flow" configuration ($\gamma = 0$ deg)
4. Functional Test with Measurement of Bucket Transit Times
- A. Prepare for test
- (1) Remove blanking part from the P3 air inlet pipe connection, located on the twin secondary nozzle front frame.
 - (2) Connect the pneumatic source to the above connection.
- B. Test sequence (refer to fig. 703)
- (1) Using the pneumatic power source, actuate the bucket drive system up to 109 RPM (bucket position $\gamma = 21$ deg.).
 - (2) Flip the "ASOV" switch to "ON" to close the air shut-off valve's electrical supply circuit (closing of the valve).

OVERHAUL

- (3) Open the air pressure supply (33.35 psig).
- (4) Flip the "TORQUE MOTOR" switch to "ON" to energize the electro-magnetic control valve (torque motor).
- (5) Flip the "ASOV" switch to "OFF" to open the air shut-off valve (electrical circuit open). The buckets shall move from 21 to 73 deg position ("reversed jet" configuration).
- (6) Check both transit time and the number of turns of the flexible shafts.
 - The transit time shall be lower or equal to two (2) seconds.
 - The number of revolutions of the flexible shafts shall be equal to 427 RPM.
- (7) De-energize the electro-magnetic control valve (torque motor) : the buckets shall return to "straight through flow" position ($\gamma = 0$ deg.).

5. Functional Test Via Actuation of the Crossfeed Isolation Valve

A. Prepare for test

This test is to be carried out on bays 2 or 3 with :

- (1) The air supply hose connected to the bay 1 or 4 air inlet tube.
- (2) The bay 2 or 3 air inlet tube blanked off.
- (3) The test bench unit's mobile connectors plugged in the bay 2 or 3 boundary electrical receptacles.

B. Test sequence

- (1) Using the pneumatic power tool, actuate the bucket drive system up to 109 RPM (bucket position $\gamma = 21$ deg.).
- (2) Flip the "ASOV" switch to "ON" to close the air shut-off valve's electrical circuit (closing of the valve).
- (3) Flip the "CROSSFEED ISOL. VALVE" to "ON" to open the crossfeed (crossbleed) isolation valve.

78-13-01

OVERHAUL

- (4) Open the air pressure supply (33.35 psig.).
- (5) Flip the "TORQUE MOTOR" switch to "ON" to energize the electro-magnetic control valve (torque motor).
- (6) Flip the "ASOV" switch to "OFF" to open the air shut-off valve (electrical circuit open). The buckets shall move from 21 to 73 deg. position ("reversed jet" configuration).
- (7) Check both the transit time and the number of revolutions of the flexible shafts.
 - The transit time shall not exceed 0.2 second in the direct (air) supply configuration.
- (8) De-energize the electro-magnetic control valve (torque motor). The buckets shall return to the "straight through flow" configuration (or zero deg. position).
- (9) De-energize the crossfeed isolation valve.
- (10) De-energize the test bench unit.

C. After completing this test, disconnect both the test bench connectors and the compressed air supply hose. Remove the transducer probe and re-install the blanking parts on the bucket ballscrew reduction gearboxes and on the nozzle P3 air inlet connections.

6. Electrical Continuity Check of the Primary Nozzle Area Transducer Electrical Harness.

- A. Use the ohmmeter defined in paragraph 2.D.(1), measure between the corresponding pins, the line resistance of each of the leads constituting the electrical harness. This line resistance shall be lower or equal to 0.5 Ohm.

from page 801

≤ 0.62 N.m (5.5 lb.in.)

Disconnect flexible shafts (15-30) and (15-40 or 15-170) of ballscrew gearbox 1 and 2. Measure the friction torque of the geartrain (without ballscrew gearbox 3 and 4, the bucket position transmitter (indicator), flexible shafts 15-50, 15-30, 15-40 or 15-170). Subtract the largest value from the torque value found during testing.

≤ 1.13 N.m (10 lb.in.)

> 1.13 N.m (10 lb.in.)

Separately check the torque value of flexible shafts 15-30, 15-40, or 15-170 (refer to following table). Replace the defective component.

Separately check the torque value of ballscrew gearbox 1 and 2 flexible shafts 15-10 or 15-150, 15-20 or 15-160 (refer to the following table).

As per value indicated
in following table

STORAGE

1. General

- A. The container used for storage and transportation of the twin secondary nozzle is designed as per the requirements of specification ATA 300, category II, i.e. : capable to withstand a minimum of ten (10) expeditions. This container is composed of three separate sections (refer to figure 901).
- (1) A lower section, made of rigid material (heavy duty plywood), which provides support for the attaching frame.
 - (2) A metallic attaching frame, anchored to the container lower section through shock-absorbing elements, accommodates the twin secondary nozzle secured to it at four mounting points.
 - (3) A plywood cover, reinforced from the inside by means of three removable tubular arches fitted to the lower section.
- B. The complete container weighs 765 kg (1672 lb)

Handling of the container is performed using a fork-lift truck. The forks minimum useful length should be 2500 mm (98.42 in).

If required for transport, the container has the capacity to accommodate the twin secondary nozzle complete with its reverse buckets.

2. Removing the twin secondary nozzle from its container

- A. Remove the container cover
- (1) Free the cover from the container lower section.
 - (2) Locate hoist and slings in position.
 - (3) Operate the hoist and clear the cover aside.
- B. Remove the protective arches.
- C. Remove the access doors to the twin secondary nozzle bucket pneumatic drive actuator recesses in order to secure the attachment points of the hoisting "T" beam - tool SC 195 -
- D. Free the twin secondary nozzle from the container attaching frame (refer to figure 902).

OVERHAUL

- (1) Unlock and remove the nuts and washers securing the front upper half-journals.
 - (2) Remove the front upper half-journals.
 - (3) Free the base plates of the rear mounting point assemblies by removing bolts and nuts (1).
- E. Position the hoisting "T" beam - tool SC 195 - and secure the strands to the structure.

NOTE : In view of the fact there currently exists two types of hoisting beam for installation of the twin secondary nozzle on nacelle, the lateral handling attachments points are provided with two adaptors (lifting arm and attachment fitting) which are considered as details of the container nomenclature. These adaptors if applicable, will have to be removed prior to securing the lateral branches of hoisting beam - tool SC 195. Figure 902.

- F. Operate the hoist, raise and remove the secondary nozzle from the container, then lower it on the transportation trolley - tool SC 36 - Secure the nozzle to the trolley and remove the hoisting beam.

3. Installing the twin secondary nozzle into the container

A. Prepare the container

- (1) Place the container in the same room as the secondary nozzle, sufficiently in advance of the packaging operation for it to attain the same temperature as the secondary nozzle, in order to avoid any risk of condensation.
- (2) Check for good condition of the container (general cleanliness, lifting and handling rings, document boxes, closures etc...)
- (3) Free the cover from the container lower section and remove it using a hoist with slings.
- (4) Remove the protective arches from the container lower section and remove the front upper half-journals.
- (5) Clean the joint faces and check for good condition of the seal, flexible mountings and internal fittings.
- (6) Wipe the container inner walls to remove any residual moisture.

OVERHAUL

B. Prepare the twin secondary nozzle

For the following operations, it is understood that the secondary nozzle is installed on the transportation trolley - tool SC 36 -

The personnel in charge of the following operations must wear synthetic rubber gloves and protect the eyes against cleaning and protecting products.

- (1) Apply CLENSEOL MECA (P 470) by dabbing on all metal parts to clean.
- (2) Wipe with clean dry rags to eliminate all traces of degreasing solvent and check that all contamination is has been removed.
- (3) Apply RUST VETO FILM 377 (P 469) by dabbing on "Stressskin" material only.
- (4) Protect the spherical bearings of the secondary nozzle front frame attachment links to nacelle with preservation oil AIR 1504 (P 223). Secure the spherical bearings with a brass wire.
- (5) Check that the blanking plugs of the cables at the level of the front boundary plane are well in place and are locked.
- (6) Blank the exhaust grids of the bucket pneumatic drive actuator using red adhesive tape.

C. Place the twin secondary nozzle into the container

- (1) Wrap the primary nozzle two lateral mounting pin assemblies in crepe paper and place them in the container accessory box.
- (2) Locate the hoisting beam - tool SC 195 - in position.
- (3) Free the secondary nozzle from the transportation trolley - tool SC 36 -
- (4) Operate the hoist to raise the secondary nozzle above the trolley and lower it into the container. Check that the front trunnions are properly seated in the half-journals.
- (5) Remove the hoisting beam and the upper handling attachment point - tool SC 194 -

OLYMPUS 593

MK.610-14-28

OVERHAUL

- (6) Position the hoisting sling (or attachment) on the rear mounting points. Before securing the hoisting sling to the structure, check that the washers are well in place (detail A figure 902).

NOTE : If one or more washers are missing take care to replace them so that during storage the hoisting sling does not damage the structure.

- (7) Position the front upper half-journals and secure them using the nuts. Tighten and lockwire nuts in pairs.
- (8) Secure the rear mounting point base plates to the container attaching frame using bolts and nuts.
- (9) Install the protective arches and secure them in the centering holes located at the upper edge of the container lower section.
- (10) Inside the container, secure to the attaching frame, the shock indicators ("hit or miss" release system) model "OMNING", calibrated to 4, 6 and 8 g, along each of the container three axes, in order to check transport and handling conditions.
If one of these shock indicators is found mechanically released and even if the equipment is apparently intact, check for absence of shock marks.
- (11) Using a hoist fitted with slings, position the container cover.
- (12) Lockwire the container and seal its closure.
- (13) In the document box located outside the container, place all the technical documents concerning the stored twin secondary nozzle (log book, shipping notes, etc ...).
- (14) Close and seal the document box

NOTE : The customs documents will be inserted in the box provided for this purpose and accessible from the outside of the container ; this box is not sealed.

- (15) In the black rectangle painted on the container, stencil mark :
- the serial number of the stored twin secondary nozzle.
 - the date of packaging
 - the duration of storage

PRINTED IN FRANCE

Page 906

Dec 15/76

OLYMPUS 593

MK.610-14-28
OVERHAUL

4. Storage duration

A. In container

Short duration (less than 3 months)

- (1) No other packaging or protection other than those carried out during preparation of the equipment are required.
- (2) Keep the container away from sunlight and adverse weather conditions.

B. Out of container

- (1) Install the twin secondary nozzle on the transportation trolley - tool SC 36 -
- (2) Pad the nozzle sharp edges using polyurethane foam tied up with adhesive tape in order to prevent tearing of the protective bag.
- (3) Cover the equipment using an anti-dust protective bag (non air-tight) made of polythene material.
- (4) Check the equipment on a 3 months period basis if ambient humidity is less than 60% ; above this humidity rate a check is necessary every month.
- (5) At the first occurrence of pitting (oxidation), clean and re-apply a protective coating as indicated in paragraph 3.B.

5. Return of the empty containers

Before returning the empty containers, the nozzle/container support fittings must be recovered, that is :

- the trunnions for the front lateral mounting points
- the totality of the rear lateral mounting points.

If these support fittings are not available due to the secondary nozzle being secured to the transportation trolley - tool SC 36 - care will be taken to place in the container the trolley support fittings similar to those of the container.

SNECMA No. 852-500-046-0

Description..... This tool allows to clamp the flexible shaft core in position in its casing during the installation and/or removal steps. Owing to the fact that each flexible shaft has two different ends, there are two types of retaining tool. Tool SC 187 comprises a set of ten (10) retaining (clamping) tools of each type.

Weight..... 0,020 Kg (0.04 lb) for each retaining (clamping) tool

Dimensions..... 60 x 35 x 22,5 mm (2.36 x 1.37 x 0.87 in.)

INTRODUCTION

1. Purpose

This illustrated parts list gives a complete list of the components required for the overhaul of an equipment.

2. Illustrated parts list

The illustrated parts list is divided into three parts :

- Introduction
- Numerical index
- Detailed parts list

A. Numerical index :

For the sake of clearness, this repertory is divided into two parts :

- (1) Index of manufacturers references beginning with a letter.
- (2) Index of manufacturers references beginning with a figure.

These indexes include all the manufacturers references for the parts described in the detailed nomenclature in alphabetical or numerical order. Opposite each reference is given the chapter-section-subject-figure-item number and the quantity.

B. Detailed parts list.

The detailed parts list gives, in disassembly order, the list and illustrations of the parts making up the assembly concerned from the origin as shown in the example paragraph B6 effectivity.

- (1) Items index numbers.

To allow simple and speedy identification, each item is given a numerical item in 10 to 10 sequence, this item will not vary during the whole life of the item.

- (2) Original item.

To cater for systematic evolution due to modifications a "letter" variant is added to the numerical item. The letter variant "A" is given in the original document to identify all the items in original definition.

78-13-01

OLYMPUS 593

MK.610-14-28
OVERHAUL

It is given in the text part only.

(3) Modified item (Item variant).

After each modification concerning an item, the numerical item of this item is maintained but the "letter" variant progresses systematically to "B", then "C", "D" etc. (letters I, O and X are not used). This variant evolution is shown in the text and on the drawings only in the case of a change. The use of the "letter" variant added to the numerical item has been made necessary to make possible the rational use of the "effectivity Code" (usage code) such as it is presented paragraph 6 of this foreword.

(4) Indent

The detailed nomenclature is presented indented showing the relation between the various items, i.e :

1 2 3 4 5 6 7

Assembly

Assembly component parts

Sub-assembly

Sub-assembly attachment parts

* * *

Sub-assembly component parts

Sub sub-assembly

Sub sub-assembly attachment parts

* * *

Sub sub-assembly component parts

(5) Quantity per assembly

The quantity indicated in the "Quantity per assembly" column is that required by the next higher assembly.

(6) Effectivity

A coded method is used to indicate parts effectivity.

This alphanumerical code indicates the installation possibilities of sub-assemblies and primary parts in relation to the next higher sub-assembly or assembly. The validity column is left blank when installation is possible in all cases.

78-13-01

**OLYMPUS 593**

MK.610-14-28

OVERHAUL

This code corresponds to the next higher assembly or sub-assembly item.

Figure Item	Manufacturers Reference	Description							Effectivity
		1	2	3	4	5	6	7	
1A	123450	Assembly							
1B	123451	Assembly (SB 1)							
1C	123452	Assembly (SB 2)							
1D	123453	Assembly (SB 3)							
10A	234560	. PRIMARY PART							1A
10B	234561	. PRIMARY PART (BS 1)							1BAC
10C	234562	. PRIMARY PART (BS 3)							1D
20A	345670	. SUB-ASSEMBLY							1A
20B	345671	. SUB-ASSEMBLY (BS 1)							1BAC
20C	345672	. SUB-ASSEMBLY (BS 2)							
20D	345673	. SUB-ASSEMBLY (BS 3)							
		. ATTACHING PARTS							
30A	456780	. PRIMARY PART							
		* * *							
40A	567890	. . PRIMARY PART							20A
40B	567891	. . PRIMARY PART (BS 1)							20BA
40C	567892	. . PRIMARY PART (BS-2)							20CAB
40D	567893	. . PRIMARY PART (BS 3)							20D

The above example shows that :

- The primary part index 10A can only be installed in assembly indexed 1A.
- The primary part index 10B can be installed in assemblies indexed 1A, 1B, and 1C.
- The primary part index 10C can only be installed in assembly indexed 1D.
- The sub-assembly index 20A can only be installed in assembly indexed 1A.
- The sub-assembly index 20B can be installed in assemblies indexed 1A, 1B and 1C.
- The sub-assemblies indexes 20C and 20D and their attaching parts indexed 30A can be installed in all assemblies indexed 1 and thus do not have an "effectivity" code.
- The primary part index 40A can only be installed in sub-assembly indexed 20A.
- The primary part index 40B can be installed in sub-assemblies indexed 20A and 20B.

78-13-01

OLYMPUS 593

MK.610-14-28

OVERHAUL

- The primary part index 40C can be installed in sub-assemblies indexed 20A, 20B and 20C.
- The primary part index 40D can only be installed in the sub-assembly indexed 20D.

(7) Figure Variant

When it is not possible to illustrate the different variants of an assembly, resulting from modifications to the basic figure, one or several supplementary illustrations will describe these variants.

These supplementary illustrations will bear the same number as that of the basic figure, followed by a letter taken in the alphabetical order (except I and O).

Whatever the number of figure variants, they will be covered by only one nomenclature.

To ascertain quickly on which figure variant the item variant is to be found, the figure variant letter will be indicated in the nomenclature, in the "index reference figure item immediately in front of the item number.

3. Using the illustrated nomenclature

The identification of a component is possible taking the following elements in consideration :

A. Through the manufacturer's reference.

Search for the manufacturer's reference in the numerical index, note the chapter-section-subject-figure-item number and refer to the corresponding nomenclature.

B. At sight of the component, without knowing its references.

Look for the figure showing the component among the illustrations this will indicate the item permitting reference to the detailed nomenclature.

TEMPORARY
REVISION**

BRITISH AIRWAYS

OLYMPUS 593

TR Page 1 of 1
26 February, 1998

OVERHAUL MANUAL

ATP: E6868

TEMPORARY REVISION No. 78-536

THIS TEMPORARY REVISION IS ISSUED BY BRITISH AIRWAYS ENGINEERING (TECHNICAL INFORMATION SERVICES, G2, TBA, S401, P. O. BOX 10, HEATHROW AIRPORT, HOUNSLOW, MIDDLESEX TW6 2JA) AND COMPLIES WITH BCAR'S CHAPTER A5-3, BS-3 AND/OR TSS No. 0-2 AS REQUIRED. CAA DESIGN APPROVAL No. DAI/8566/78.

For CHIEF ENGINEER QUALITY AND TRAINING

Manual Reference 78-13-01 Page 1101-0

REASON FOR REVISION

To specify alternative bolt part numbers.

ACTION

Figure 1

NOTE: On the thrust reverser vane deflector assembly bolts, as specified in Figure 1, the NAS6304U# series bolts may be replaced by the equivalent NAS6704U# or BACB30LJ4U# bolts of identical grip length. The grip length (#) is the number quoted after the 'U'.

e.g. NAS6304U19 may be replaced by NAS6704U19 or BACB30LJ4U19.

Originator: T.Bertrand
Reference: EPA0041
Workbook: GE 78-52

DESCRIPTION - OPERATION

1. General

A. Introduction

The buckets (figure 1) fitted to the twin secondary nozzle have two functions :

- (1) They control the expansion of the gas issuing from the primary nozzle. Their variable position allows the achievement of optimum performance in all the various flight configurations,
- (2) They block and re-direct the gas flow in the reverse-thrust configuration.

B. General characteristics

Each assembled bucket weighs approximately 80 kg (176 lb). The major dimensions are :

- length..... 1300 mm (51.2 in)
- width..... 750 mm (29.5 in)
- height..... 700 mm (27.6 in).

2. Description of an assembled bucket

The assembled bucket (figure 2) comprises :

- a primary heat shield (2),
- a secondary heat shield (3),
- two side plates (4),
- a seal (5) in five segments,
- two spherical bearing housings (6),
- a basic bucket (1) to which the above parts are fitted.

A. The primary heat shield

The primary heat shield (2) is a panel in austenitic alloy. It is fixed to the basic bucket (1) and forms the contact surface with high temperature exhaust gases.

B. The secondary heat shield

The function of the secondary heat shield (3) is to protect the basic bucket (1) against the heat emitted by the exhaust gas.

This shield-manufactured in Min-K material is a flexible shield composed of quartz-glass fiber sandwiched between

MK.610-14-28
OVERHAUL

two sheets of wafered stainless steel.

C. The side plates

Each bucket is fitted with two side-plates (4) in austenitic steel honeycomb structure, which are fixed to the basic bucket. They provide thermal protection for the bucket-to-structure hinge points, and ensure continuity of the shape of the nozzle in all bucket configurations.

D. The seal

The seal is manufactured in austenitic alloy and is located on the front section of the bucket. This seal (5) in 5 segments forms the profile of the leading edge of the bucket.

E. The spherical bearing housings

There are two spherical bearing housings (6) per bucket, fitted into bores in the basic bucket (1). They are prevented from rotating by a pin (7) and from axial movement by a nut (8). Each housing takes a spherical bearing (9).

F. The basic bucket

The basic bucket (1) is the main working component, since it is the most heavily loaded part during the reverse thrust operation.

The basic bucket unit cannot be dis-assembled, and comprises

- (1) a structural frame-work and stringers, to which are fixed machined-from-solid parts such as :
 - the hinge-point supports which take the spherical bearing housings,
 - the yokes to which the bucket actuation ball-screw gear-boxes are attached.
- (2) internal and external skins in honeycomb structure rivetted to the frame-work.

DISASSEMBLY

1. General

- A. During disassembly, follow the recommendations given in chapter 70-05-00 of the manual of standard practices and in the working procedures section of the Overhaul Manual.
- B. Use only tools and other special equipment nominated in the disassembly procedures, and identified by a number SC... The tools are shown in the illustrated tools and equipment manual (I.T.E.M.).
- C. During disassembly, visually inspect all parts removed and report to the inspection department, any defects found which could be obliterated by cleaning (scratches, burning, etc...) and which may result from incorrect operation. Also, report any broken parts or any missing locking devices.
- D. In the working procedures section of the manual, parts are referenced to the IPL by two numbers in brackets, the first of which is the figure number in the IPL in which the parts are shown, the second being the item number within that figure.

2. Disassembling the buckets

The operations hereafter are to be carried out for each bucket.

NOTE : The buckets are disassembled when set up on storage stand - tool SC 37.

A. Removing the seal segments

- (1) Remove screws (1-170), collect washers (1-180) and remove seal segment (1-190).
- (2) Remove screws (1-200), collect washers (1-210) and remove seal segment (1-220).
- (3) Remove screws (1-230), collect washers (1-240) and remove seal segment (1-250).
- (4) Remove screws (1-260), collect washers (1-270) and remove seal segment (1-280).
- (5) Remove screws (1-290), collect washers (1-300) and remove seal segment (1-310).

78-31-01

Page 101
Dec 30/74

OLYMPUS 593

MK.610-14-28

OVERHAUL

B. Removing side plate (1-50)

- (1) Remove screws (1-60) and collect spacer plate (1-70).
- (2) Remove screws (1-80) and collect spacer plate (1-90).
- (3) Remove screws (1-100) and collect shims (1-105) and (1-107).
Identify the latter.
- (4) Remove side-plate (1-50).

C. Removing side plate (1-110)

- (1) Remove screws (1-120) and collect spacer plate (1-130).
- (2) Remove screws (1-140) and collect spacer plate (1-150).
- (3) Remove screws (1-160) and collect shims (1-165) and (1-167).
Identify the latter.
- (4) Remove side-plate (1-110).

D. Removing spherical bearing housings

The operations hereafter are to be carried out for each housing :

- (1) Rotate and remove spherical bearing (1-350).
- (2) Unlock nut (1-330) by grinding locking plate (1-320) attaching weld. Remove locking plates (1-320).
- (3) Unscrew nut (1-330), using wrench - tool SC 40.
- (4) Fit the extractor - tool SC 41 - and remove spherical bearing housing (1-340) ; collect anti-rotation pin (1-360).

E. Removing heat shields

- (1) Remove screws (1-10).
- (2) Remove primary heat shield (1-30).
- (3) Remove secondary heat shield (1-40).
- (4) Remove threaded sleeves (1-20), using the special wrench - tool SC 206.

OVERHAUL

F. Removing cover assemblies

The operations hereafter are to be carried out for each cover.

- (1) Slightly loosen screws, rotate and remove cover (1-370).

G. Removing bushings

- (1) Remove bushings (1-380) and (1-390) together with bushings (1-400) and (1-410) located in the attaching yoke of bucket ball screw gear box end-pieces.

CLEANING

PRINTED IN FRANCE

1. General

- A. After disassembly, clean all the parts of the bucket thoroughly in order to remove all the surface contamination such as oils, greases, carbon deposits, corrosion and oxidation marks.
- B. The purpose of cleaning is to :
 - (1) Allow thorough visual inspection of parts.
 - (2) Disclose cracks due to system operation through use of fluorescent penetrant inspection methods.
 - (3) Prepare the surfaces in view of future repair work.

2. Specific recommendations

- A. Any cleaning method selected by an operator shall comply with the following requirements to avoid penalization on the service life of parts.
 - (1) Do not degrease titanium parts, welded or not, using halogen products such as chlorinated solvents, trichlorethylene etc...
 - (2) Do not clean in acid baths parts having complex shapes or featuring blind holes i.e. parts on which rinsing or neutralization are difficult to carry out properly.
 - (3) Do not use cleaning agents the action of which may induce generalized or intergranular corrosion of materials, particularly on those materials showing aging due to operation on engine.
- B. Limitations related to electro-platings, chemical surface treatments, paints, varnishes, and hardface metal coatings.
 - (1) The cleaning methods recommended in this chapter are not harmful to the surface treatments applied on the bucket constitutive parts.

78-31-01

ATP TEMPORARY REVISION

BRITISH AIRWAYS

OLYMPUS 593 OVERHAUL MANUAL
EXHAUST SYSTEM THRUST REVERSER BUCKET

This Temporary Revision complies with BCAR's Chapter A6-2 and TSS No. 0-2.

for Chief Engineer (Technical & Quality Services) CAA Design Approval No.
DA1/8566/78

TEMPORARY REVISION 78-526

Insert in 78-31-01 facing page 301

REASON FOR ISSUE

To introduce a Refurbishment Specification to the Thrust Reverser Bucket Overhaul (MCR.EPO.453/MD).

ACTION

Concorde Exhaust System Refurbishment

Introduction

The exhaust system consists of four main components:-

- (a) The Reheat Jet Pipe
- (b) The Primary Nozzle
- (c) The Twin Secondary Nozzle
- (d) The Thrust Reverser Bucket

Their Refurbishment Specifications are as follows:-

Reheat Jet Pipe	CON 78.11.01.100 Issue 1
Primary Nozzle	CON 78.12.01.100 Issue 1
Twin Secondary Nozzle	CON 78.13.01.100 Issue 1
Thrust Reverser Bucket	CON 78.31.01.100 Issue 1

These refurbishment schedules fulfil the life development requirements of the Approved Maintenance Schedule (A.M.S.).

The work listed in the Refurbishment Schedule is to allow the unit to be considered as a "Condition Monitored" (C.M.) unit.

This means that such units are currently considered to have no known hidden "wear out" features that require planned time interval specific inspections. However, such units may be required to be stripped and inspected purely to gain experience of their condition, i.e. life samples when it is considered that opportunity arisings of strip and inspection are inadequate. Such life sampling requirements will be indicated by an A.M.S. revision.

Notes

Where the term "visual inspection" is used, it implies a visual inspection of all parts exposed arising either as a result of the minimum work content of the Refurbishment Schedule or to a greater depth of strip dictated by other reasons, i.e. repair of damage embodiment of modifications, etc.

When in the course of visual inspection evidence exists, e.g. wear witness, distortion, etc. that requires further stripping, it must be referred to Propulsion Engineering for a review of acceptance standards and agreement to further strip

BRITISH AIRWAYS

OLYMPUS 593 OVERHAUL MANUAL EXHAUST SYSTEM REHEAT JET PIPE

TEMPORARY REVISION No. 78-526 (Cont'd.)

Concorde Exhaust System Refurbishment Thrust Reverser Bucket

Specification No. CON 78.31.01-100 Issue 1

1. The Bucket is to be disassembled IAW OHM 78-31-01 P/B 100.
2. At the completion of disassembly, clean thoroughly all the parts of the Bucket so as to remove all surface contamination such as oils, greases, carbon deposits, corrosion and oxidation marks IAW OHM 78-31-01 P/B 200.
3. Crack detect parts listed in OHM 78-31-01 Bucket assembly removable parts page 302 to 303 and 78-31-01 Basic Bucket inspection methods page 308. Parts failing to meet the required standard must be held for possible repair development.
4. Visually inspect all parts IAW OHM 78-31-01 P/B 300 and repair as required. Any part that is damaged beyond the repair limits must be held for possible repair development. Any part that is damaged and has no cleared repair scheme must be held for possible repair development.
5. Embody Modifications IAW the BA Modification call up list.
6. Inform Propulsion Engineering of any defects found during refurbishment.
7. Re-assemble the Bucket IAW OHM 78-31-01 P/B 500.
8. The Bucket inspection and release documentation is to state the specification number to which the unit has been refurbished.

OLYMPUS 593

MK.610-14-28
OVERHAUL**SEE TR**INSPECTION1. Breakdown of the Inspection Section

The "Estimate" inspection of the Bucket Assembly includes the following chapters :

- General
- Bucket Assy. - Removable parts
- Basic Bucket

This last chapter itself, is divided into paragraphs as follows :

- Introduction
- Identification
- Restricted areas
- Inspection methods
- Permissible damage

This breakdown of the Inspection section results in a different pagination for each chapter and paragraph, of the following kind :

Chapter "Removable parts"

78-31-01

BUCKET ASSY. - REMOVABLE PARTS

Page 301

Jun 30/76

Chapter "Basic bucket"

2. General

A. Inspection - General

- (1) The Estimate Inspection, prepared during overhaul on the modules or separate disassembled components, has the object of :

Eliminating worn or deteriorated components which are impossible or too costly to be repaired. However, these components can be kept because certain sound portions of them may be usable for the repair of an

78-31-01

OVERHAUL

B. Preparation to the "Estimate" Inspection

- (1) Following disassembly, suitable cleaning for each component is given in the "Cleaning" section of the Overhaul Manual.

NOTE : Take care that any assembly "awaiting inspection" be stored in the "bins" or containers for this purpose.

This inspection must be carried out on thoroughly clean parts.

Place all the parts, making up the sub-assemblies, on the inspection tables covered with anti-shock material (lino or similar material).

- (2) Make a list of the modifications to be applied for each sub-assembly.
- (3) Inspect the parts.

C. "Estimate" Inspection

CAUTION : THE COMPONENTS MUST BE HANDLED WITH THE GREATEST CARE DURING THE INSPECTION OPERATIONS SO AS TO AVOID SHOCKS, SCRATCHES, ETC ...

- (1) Personnel in charge of this inspection must have a thorough knowledge of the instructions given in the Inspection and Repair sections of this manual and in the corresponding chapter 70.

They must be conscious of the importance of their decisions and their consequences. A good technical and functional knowledge of the accessory will enable this personnel to carry out an efficient and intelligent inspection, particularly in vital zones.

- (2) The inspection methods to be used are as follows :

Visual inspection
Inspection for soundness
Dimensional inspection

NOTE : It is recommended that these inspection methods be followed as per the indicated order so that faulty, not repairable components detected during visual or soundness inspections can be scrapped prior to dimensional inspection.

If new types of defects are disclosed, the repairer shall request SNECMA to design a repair scheme.

OLYMPUS 593

MK.610-14-28

OVERHAUL

(3) Measuring instruments for dimensional inspection

Choice of the measuring instrument must be made in relation to the precision desired.

(a) Instrument classification

Two kinds of measuring instruments are to be distinguished :

Standard and universal inspection tools such as : slide gages, micrometers, depth gages, miscellaneous dial gages, etc ...

This equipment is part of the provisioning items commercially available and requires no particular comment provided that it is available in the required quantity and precision, and satisfies to the requirements for the work to be undertaken.

Special inspection equipment such as : bases, supports, rigs, jigs, etc ...

These tools are identified by a type number in the manual text at the exact place where they are used.

(b) Calibration

Measuring instruments used in overhaul are to be checked periodically according to a procedure defined in relation to master instruments (SNECMA to be informed of procedure), themselves checked in relation to the official master instruments of the country concerned.

The Official Control Authorities of the countries where repairs are carried out will have to take steps to ensure that the repairer has set up suitable facilities and equipment.

In the absence of a procedure in the countries concerned, the repairer will request from SNECMA the procedure applied in their own workshop.

(4) During the inspection, each component must be labelled (see chapter 70-10-00) so as to indicate :

If it is further serviceable

If it needs to be repaired

If it must be renewed.

MK. 610-14-28

OVERHAUL

sneema

Labelling of components may also be used to note the value of certain measured dimensions which can affect a clearance or a tolerance. This makes it possible for the Inspection Dpt. to check the clearance or tolerance during final assembly.

D. Protection against corrosion after inspection

- (1) After inspection, when 3 months elapses before rebuild, carry out a temporary protection to carbon steel, alloy steel and martensitic alloy parts using a dessicant oil such as ENSIS Fluid 254 (P309) or ARDROX 396/1E8 (P373) or RUSTILO DW377 (P373).

INSPECTION

BUCKET ASSY. - REMOVABLE PARTS

1. Introduction

This chapter gives all the data needed for the visual, soundness and dimensional inspections to be carried out on the removable parts of the bucket assy.

2. Visual inspection

A. Visual inspection is an operation which starts on reception of the buckets (inventory), continues during disassembly, on table inspection, re-assembly, testing and dispatching.

- (1) Visual inspection generally concerns the following points :

Each part is inspected to ascertain its general condition and make sure that it is fit for service. Refer to chapter 70-21-00.

Threads and tapped holes must not be deteriorated.

Rivets used to attach the various components on riveted assemblies must not be shaken loose, rotating or missing, otherwise change them.

Self-locking nuts must have a satisfactory locking torque. See chapter 70-21-00, otherwise change them.

Crimped self-locking nuts must be satisfactorily crimped. See chapter 70-21-00, otherwise change them.

Articulation parts must not show seizing marks or scratches, otherwise remove them using emery cloth.

Components made up of sheet metal elements and/or "STRESSKIN" material must not show nicks, tears, heavy distortions and/or, burns.

Parts featuring plated areas (metallization) must not show flaking conditions, otherwise renew the metallization as indicated in the "Repair" section of the Manual.

OLYMPUS 593

MK.610-14-28

OVERHAUL

Parts featuring a protective surface coating must not show bare or flaked areas, otherwise recondition coating as indicated in "Repair" section of the Manual.

- (2) Measures to be taken in relation to the damage affecting the parts are given in paragraph 5 "Parts Inspection".

3. Inspection for Soundness

- A. The object of the inspection for soundness is to ensure that the components are not cracked.

The inspection methods used are as follows :

Visual inspection :

Dye penetrant inspection : see chapter 70-20-10.

M 502 - Water-washable fluorescent penetrant inspection.

M 504 - Post-emulsification fluorescent penetrant inspection.

X-Ray radiographic inspection - See chapter 70-20-30.

- B. The following table gives the list of parts and their appropriate methods.

PARTS TO BE INSPECTED		INSPECTION METHODS	REMARKS AND ZONES REQUIRING CAREFUL EXAMINATION
IPL	DESCRIPTION		
1-10	Screw	M 504 B	(1)
1-20	Threaded sleeve	M 504 B	(1)
1-30	Primary heat shield	M 502 B	
1-40	Secondary heat shield	Visual	
1-50/110	Side plate	X-Ray	Method described in par. 5

- (1) If any crack is found, scrap the part.

(1) If any crack is detected, scrap the part.

4. Dimensional Inspection

Details concerning the dimensional inspection and acceptance criteria are given in paragraph 5, "Parts Inspection".

5. Parts Inspection

A. Screw (1-10)

(1) Visual inspection

(a) Check screw thread silver plating.

Silver plating in poor condition is not acceptable and requires screw re-plating. REP 1-10-1.

(b) Check condition of the plasma protection below the screw head.

Protection flake or wear are not acceptable. Rework protection, if necessary.

B. Threaded sleeve (1-20)

(1) Visual inspection

(a) Check silver plating of sleeve external thread.

Silver plating in poor condition is not acceptable and requires thread re-plating. REP 1-20-2.

- (b) Check condition of the plasma protection located on the bearing face of screw (1-10).
Protection flake of wear are not acceptable. Rework protection, if required. REP 1-20-1.

BA

C. Primary heat shield (1-30)

(1) Visual inspection

- (a) Check condition of the plasma protection on side edges. Protection flake or wear are not acceptable. Rework protection, if required. REP 1-30-2.

BA

- (b) Repair fretting by direct welding in accordance with BOR 2.

BA
BA

- (c) Damaged shims and riveted inserts must be renewed. Repair in accordance with REP 1-30-1.

BA

- (d) Worn condition of heat shields:

- at their leading edge, as a result of mechanical interference with the bucket seal segments;
- at their trailing edge, as a result of interference with the heat shields back-up plates,

is acceptable if the remaining thickness is higher than 0,9 mm (0.035 in.).

Beyond this value, repair through metallization as per REP 1.30.2 or through welding as per REP 1.30.3.

Fretting adjacent to inserts repair in accordance with BOR 41.

BA
BA

(2) Inspection for soundness

- (a) Cracks developing inside heat shield metal sheet are not acceptable.
If any, store the part pending a possible repair, in quarantine.

BA
BA

(3) Dimensional inspection

- (a) Check accuracy of generatrices.

A distortion lower than or equal to 2 mm (0.079 in.) is acceptable.

Above this value, reshape heat shield.

D. Secondary heat shield (1-40)

(1) Visual inspection

- (a) Deterioration of the metal seal secured around heat shield is not acceptable. Repair in accordance with REP 1-40-1 (Seal Pt. No. 302-061-200-0).

OVERHAUL

(b) Check by feel that "Sindanyo Blocks" sunk into "Min K" wafered steel sheet at the location of generatrices bearing on the primary heat shield are not crushed.

(c) Nicks in "Min K" sheet are not acceptable.

If any one of these defects is evidenced, repair the secondary heat shield by renewing the damaged components or installing resistance-welded patches

(d) Repair cracks in skin by direct welding in accordance with BOR 3.

(e) Repair drum flanges when chafed or cracked in accordance with BOR 13.

E. Side plate assy (1-50, 1-110)

(1) Visual inspection

(a) Shaken or damaged inserts must be renewed.

(b) Damaged helicoil inserts must be renewed.

(c) Loose or missing rivets on the doublers must be renewed.

(2) Inspection for soundness

(a) Method

Inspection for soundness of side plates is carried out through X-Ray inspection according to instructions given in chapter 70-20-30 and as shown in figure 301.

(b) Acceptance criteria

Cracks developing in reinforcement sheets involve repair in accordance with BOR 24.

Cracks developing in side plate stressskin panel involve repair in accordance with BOR 26.

Ribbon dislocation in stressskin panel entails scrapping of side plate.

F. Seal segment (1-190/220/250/280/310)

(1) Visual inspection

(a) Seal wear is acceptable if not associated with cracking and if the sheet metal remaining thickness is higher than 0,4 mm (0.016 in.).

(b) Repair slight wear in accordance with BOR 44. Plasma spray.

(c) Direct weld fretting in accordance with TR 78-1884.

78-31-01

BUCKET ASSY. - REMOVABLE PARTS

(b) Check by feel that "Sindanyo Blocks" sunk into "Min K" wafered steel sheet at the location of generatrices bearing on the primary heat shield are not crushed.

(c) Nicks in "Min K" sheet are not acceptable.

If any one of these defects is evidenced, repair the secondary heat shield by renewing the damaged components or installing resistance-welded patches.

E. Side plate assy (1-50, 1-110)

(1) Visual inspection

- (a) Shaken or damaged inserts must be renewed.
- (b) Damaged helicoil inserts must be renewed.
- (c) Loose or missing rivets on the doublers must be renewed.

(2) Inspection for soundness

(a) Method

Inspection for soundness of side plates is carried out through X-Ray inspection according to instructions given in chapter 70-20-30 and as shown in figure 301.

(b) Acceptance criteria

Cracks developing in reinforcement sheets involve renewal of said sheets. Refer to REP 1-50-2.

Cracks developing in stressskin panel under reinforcement sheets are serviceable, providing not from side to side of side plate edges.

Cracks developing in stressskin panel out of cover sheets are not serviceable and must be eliminated by weld filling-up. Refer to REP 1-50-3.

Ribbon dislocation in stressskin panel entails scrapping of side plate.

F. Seal segment (1-190/220/250/280/310)

(1) Visual inspection

- (a) Seal wear is acceptable if not associated with cracking and if the sheet metal remaining thickness is higher than 0,4 mm (0.016 in).

Otherwise, scrap the part.

G. Nut (1-330)

(1) Visual inspection

(a) Check nut thread silver plating.

Poor condition of silver plating is not acceptable and requires reworking.

H. Spherical bearing housing (1-340)

(1) Visual inspection

(a) Check condition of spherical bore.

Poor condition of silver plating is not acceptable and requires reworking.

(2) Dimensional inspection

(a) Make sure that the spherical bore is within the following tolerances :

$\varnothing 73,025 \text{ H7 } + 0,03$
 $+ 0$ mm (2.8750 in.) dia.

Above this value, rework by silver plating per Repair 1-340-2.

(b) Make sure that the spherical bearing housing fit diameter is greater than or equal to 85,73 mm (3.3753 in.) dia.

Otherwise, rework by nickel plating per Repair 1-340-3.

I. Spherical bearing (1-350)

(1) Visual inspection

(a) Check condition of spherical diameter and bore. The presence of a fine hairline crack network due to the original machining (by grinding) is normal. The presence of pitting, major cracks, blisters, exfoliation or any other defect that may be detrimental to the part are not acceptable, rework by chrome plating per Repair 1-350-2.

INSPECTION

BASIC BUCKET

1. Introduction

This chapter gives all the pertinent information to carry out the visual soundness and dimensional inspections of the basic bucket.

These information are arranged in the following order :

Paragraph 2 - Identification

This paragraph provides for identification of the bucket components and gives the material constituting each component as well as the thickness of parts manufactured from sheet metal material

Paragraph 3 - Restricted areas

This paragraph defines the structural areas for which the mechanical strength is the essential criterion and to which any damage and repair might affect the useful life of the bucket.

Paragraph 4 - Inspection methods

This paragraph defines the visual, aural and radiographic methods used for inspection of the bucket.

Paragraph 5 - Permissible damage

This paragraph specifies the damage extents beyond which it is necessary to apply a specific repair scheme.

PRINTED IN FRANCE

BASIC BUCKET - INTRODUCTION

Pages 301/302

Dec 15/76

OLYMPUS 593

MK.610-14-28
OVERHAUL

2. Identification

This paragraph defines the bucket basic components.

These are classed in two categories :

Bucket structure

Bucket inner and outer stresskin panels.

A. Bucket structure

The structural components are defined on Figure 302.

For each component is given :

the material identification (P xxxx type, refer to the
SNECMA's Products File, or
AFNOR type for forged and/
or cast parts)

the material thickness for the parts manufactured from
sheet metal.

B. Bucket inner and outer stresskin panels

These components are defined on Figure 303.

For each component is given :

the material identification (P xxxx type, refer to the
SNECMA's Products File).

the panel thickness

NOTE : In the case of a chemically milled panel, it is
illustrated separately so that to outline on a
diagram the thickness variations on both its
internal and external face sheets.

These information are necessary in order to
ensure correct assessment of damage.

C. Bucket effectivity

This paragraph "Identification" includes all the bucket va-
riants , as a result, the effectivity is indicated on all
the pages wherein differences between the buckets appear.

The effectivity is expressed as follows :

78-31-01

BASIC BUCKET - IDENTIFICATION

Page 301

Dec 15/76

OLYMPUS 593

OVERHAUL

(1) Summary of all the bucket variants.

- A

 Buckets No. 1 to 64
- B

 Buckets No. 65 and up Nos.

(2) On the illustrations :

- (a) In the case where any one page "Identification" is applicable to all the buckets, the effectivity is not indicated.
- (b) In the case where any one page "Identification" includes pieces of information relative to different bucket variants, the following cases are to be envisaged :

1st case : The concerned zone keeps the same graphic representation, but certain parts are manufactured from an other material or incorporate minor changes thus requiring complementary data in the identification table.

In this case, effectivity is indicated by :

- placing the framed letter near the part's identification index,
- adding, below the previously existing index, a new index followed by the framed letter corresponding to the variant.

Example :

20

A

 Part's old configuration corresponding to bucket variant

A

100

B

 Part's new configuration corresponding to variant

B

2nd case : In the concerned zone, a new component, specific to one bucket or a batch of buckets, is incorporated.

In this case, the effectivity is indicated by placing the framed letter after the new part's index.

PRINTED IN FRANCE

3. Restricted Areas

This paragraph defines the structural areas for which the mechanical strength is critical and to which any damage and repair might affect the useful life of the reverse bucket.

Breakdown of this paragraph is as follows :

- Restricted areas of the bucket structure - Figure 302.
- Restricted areas in the bucket inner and outer stressskin panels : Figure 303.

PRINTED IN FRANCE

4. Inspection Methods

The inspection methods used to assess the condition of the bucket are the following:

- Visual check
- Aural check
- Radiographic inspection
- Dimensional inspection

A. Visual check

It consists in:

- Viewing zones with straight - through access using, if required, a binocular (magnifying power: X 10).
- Viewing box-type zones via the orifices (borescope parts) provided using a borescope (see figure 301).

NOTE: The borescope instrumentation currently used by SNECMA for inspection of buckets consists in a flexible borescope "OLYMPUS" 11 mm (0.433 in) dia. and a direct view.

This visual check is intended for:

- (1) Check condition of riveted nut threads, helicoil thread inserts of crimped blind nuts attaching:
Seal segments at the location of the leading edge.
Heat shield on inner panel.
Side plates and deflectors at the location of bucket hubs.
- (2) Check condition of the various member attachments (rivets, bolts):
On the outside of the bucket, by sight.
On the inside of the bucket, using a flexible borescope (see figure 301).
- (3) Check condition of the stressskin panels mainly for evidence of damage such as: cracks, nicks/dents, tears, wrinkles, wear, etc.

NOTE: In case cracks are suspected on stressskin panels in cavities, perform the X-Ray radiographic inspection.

78-31-01

BASIC BUCKET - INSPECTION METHODS

Page 301

Dec 31/01

OLYMPUS 593
MK. 610-14-28
OVERHAUL

B. Aural check

This check is carried out using a small metal part (coin) by striking the stressskin panel lightly.

The purpose of this check is to reveal any delamination (peeling-off) or deterioration of the inner ribbon.

A panel in good condition produces a clear sound.

A panel with a damaged ribbon produces a dull sound.

NOTE: This method of inspection is less efficient in zones where the panel is in contact with a bracket or a structural element, and also when the panel is crushed.

The aural check is carried out on the bucket internal and external skin panels, by tapping evenly at every 3 or 4 cells.

C. X - Ray radiographic inspection

This inspection is performed using an X-Ray unit fitted with a long anode, in accordance with the instructions of chapter 70-20-30, "RADIOGRAPHIC INSPECTION" and as indicated on Figure 302.

The purpose of this inspection is to reveal:

- cracks in stressskin panels,
- delamination (peeling-off) or deterioration of ribbon in stressskin panels.

NOTE: Perform this inspection only to clear about cracks on stressskin panels in cavities, revealed by visual check using a flexible borescope.

D. Dimensional inspection

The bucket dimensional inspection is performed using standard inspection tooling.

The checks to be carried out are the following:

- (1) Inspection of bucket hinge center-to-center distance:

The purpose of this inspection is to make sure that the buckets will be assembled within acceptable stress conditions.

78-31-01

BASIC BUCKET - INSPECTION METHODS

Page 302

Dec 31/01

OLYMPUS 593

MK. 610-14-28

OVERHAUL

SNECMA

NOTE: The value taken (dimension "M") does not precisely correspond to the hinge centre-to-centre distance of the bucket but rather to the outer width perpendicular to the hinge ; the purpose has been to facilitate comparison with the value measured on the twin secondary nozzle.

(2) Inspection method (see figure 303)

Rig bucket on its external section.

Using a micrometer, measure the "L" value on each side of bucket hub to take into consideration a possible bearing inclination.

To obtain the "M" value, add 53,08 mm (2.090 in.) to the measured "L" value.

This 53,08 mm equals twice the nominal half-thickness of the inch fitting (hub) plus twice the nominal distance between the centreline and the outer surface of the spherical joint.

The value "M" must be included between 1254,1 and 1258,6 mm (49.374 and 49.551 in.).

Beyond these limits report to SNECMA Commercial Product Support.

5. Permissible damage

This paragraph defines the maximum extent of acceptable defects beyond which a repair scheme must be applied.

These permissible damages are categorized as follows :

- Acceptable damage affecting the bucket inner and outer skin panels.
 - Acceptable damage affecting the bucket structure.
 - Acceptable damage affecting the bucket dimensional characteristics (distortion, wear...).
- A. Acceptable damage affecting the bucket inner and outer skin panels.
- (1) Introduction
- (a) Within the damage acceptance limits established for the skin panels, two cases are to be considered :
- General case :
Zones where the panel provides only for streamlining or carries minor loads
 - Case of the restricted areas :
Zones where the panel carries heavy loads and/or, wherein the mechanical strength is essential
- NOTE : The restricted areas are defined in paragraph 3.
- (b) Cumulative damage are permissible so long as, within an area designated "mesh" and delimited by the frames (Ref. Fig. 301), the sound area which separates two defects is, at least, equivalent to the most stringent criterion relevant to the said defects.
- (c) The damaged areas may be adjacent to one or more attachment points provided that acceptance limits for ineffective attachment points are not exceeded.

NOTE : Any damage adjacent to an attachment point is tantamount to the loss of its positive retention capacity (effectiveness).

OVERHAUL

(2) Acceptable damage

(a) Impact damage (Ref. Fig. 302)

CAUTION : IF IMPACT HAS CAUSED A CRACK OR A HOLE,
REFER TO THESE TYPES OF DAMAGE FOR THE
ACCEPTANCE LIMITS.

The acceptance limites for the three types of
impact damage considered are the following :

Case I : Dent contained within one cell without
crushing of the core ribbon (or cell
wall).

- . Max. depth of dent : 1 mm (0.04 in.) with a
width to be at least equal to 5 times the depth.
- . Sound area around such defect :
General case : 45 mm (1.77 in.)
Restricted areas : 75 mm (2.95 in.)
- . Max. acceptable number of such type of damage
affecting one mesh : 6

Case II : Dent contained within 3 or 4 cells at
maximum and associated with crushing of
the core ribbon.

- . Max. depth of dent : 1,5 mm (0.06 in.) with a
width to be at least equal to 10 times the
depth.
- . Sound area around such defect :
General case : 100 mm (3.94 in.)
Restricted areas : 200 mm (7.87 in.)
- . Max acceptable number of such type of damage
within one mesh : 3.

Case III : Impact affecting a large surface area.

Such impacts are unacceptable.

Impact damage beyond acceptance limits
necessitate the repair of the panel.
The type of repair is determined by
the damage extent and location. Refer
to chapter "REPAIR" of the Overhaul
Manual.

BASIC BUCKET - PERMISSIBLE DAMAGE

Pages 302A/302B

Mar 31/78

- (b) Round bottomed crushing (crease).

CAUTION : IF THIS DEFECT SHOWS SHARP EDGES OR HAS INDUCED A CRACK, REFER TO THE ACCEPTANCE LIMITS FOR CRACKS.

This damage is unacceptable.

The type of repair is determined by the damage extent and location. Refer to chapter "REPAIR" of the Overhaul Manual.

- (c) Wrinkles on skin panel face sheets

CAUTION : IF THIS DEFECT HAS RESULTED IN CRACKING REFER TO THE ACCEPTANCE LIMITS FOR CRACKS.

This damage is unacceptable.

The type of repair is conditioned by the damage extent and location. Refer to chapter "REPAIR" in the Overhaul Manual.

- (d) Delamination (core-to-face sheet separation) or deterioration of core ribbon.

NOTE : Such defects may possibly cause the buckling or bubbling out of plane of the panel face sheet.

This damage is unacceptable.

The type of repair is conditioned by the damage extent and location. Refer to chapter "REPAIR" in the Overhaul Manual.

- (e) Cracking

This damage is unacceptable.

The type of repair is determined by the damage extent and location. See chapter "REPAIR" in the Overhaul Manual.

- (f) Loss of positive retention at the attachment points (see figure 303).

This condition may be caused by :
 - a missing fastener (rivet, bolt, etc...)
 - a loose fastener
 - a deteriorated panel in the area of attachment point.

78-31-01

BASIC BUCKET - PERMISSIBLE DAMAGE

Page 303

Dec 15/76

OLYMPUS 593

MK.610-14-28
OVERHAUL

In the case of a missing or loose fastener, re-install a new fastener.

In the case of panel deterioration next to the attachment point, the latter becomes ineffective and the following limits shall apply :

General case : Ref. Figure 303 (sheet 1 of 4)

- . Of the two first attachment points located at each end of a row of fasteners, at least one (1) must remain effective.
- . In same row, two ineffective attachment points must be separated by two effective ones at least.

Particular case :

The particular cases are defined on Figure 303 (sheets 2 thru 4).

B. Acceptable damage affecting the bucket structure.

(1) Introduction

The acceptable damage on the bucket structure are categorized depending on the type of parts affected and as follows :

- Acceptable damage on structural members, stringers, frames, yokes (forged, cast or machined-from-solid parts)
- Acceptable damage on sheet metal components
- Acceptable damage on the attaching hardware (fasteners).

Within the acceptance limits for damage affecting the bucket structure, two cases are to be considered :

General case

Zones where the structure carries minor loads

Restricted areas

Zones where the structure carries heavy loads and/or wherein the mechanical strength is essential.

PRINTED IN FRANCE

78-31-01

BASIC BUCKET - PERMISSIBLE DAMAGE

Page 304

Dec 15/76

OLYMPUS 593

MK.610-14-28

OVERHAUL

NOTE : The restricted areas are defined in paragraph 3.

(2) Acceptable damage on structural members.

(a) Cracking

Cracks are unacceptable.

The type of repair is determined by the crack extent and location. See chapter "REPAIR" in the Overhaul Manual.

(3) Acceptable damage on sheet metal components

(a) Cracking

Cracks are unacceptable.

The type of repair is determined by the crack extent and location. Refer to chapter "Repair" in the Overhaul Manual.

(b) Rear back-up plates wear.

Worn condition of the bucket rear back-up plates due to interference with the bucket heat shield is acceptable if less than 0,3 mm (0.012 in.) in depth.

Beyond this tolerance, renew the back-up plates.

(c) Bucket leading edge wear.

1 If the bucket L.E. is worn as a result of a rough landing, renew leading edge element.

2 If the bucket L.E. is worn without cracks or holes and if the wear is caused by the contact with the seals of the T28, recondition the part. See chapter "REPAIR" in the Overhaul Manual.

(4) Acceptable damage on attaching hardware (fasteners)
The fasteners are classified into two categories :

- fasteners for retaining the removable parts
- fasteners used for structural assembly purposes.

78-31-01

BASIC BUCKET - PERMISSIBLE DAMAGE

Page 305

Apr 30/93

OLYMPUS 593

MK.610-14-28

OVERHAUL

(a) Fasteners for retaining removable parts :

The deterioration of this kind of fasteners is unacceptable.

Renew damaged fasteners by applying the following repair schemes :

REP 1-460-1-Renewal of Heli-coil thread inserts providing for retention of heat shields.

REP 1-460-2-Renewal of attachment hardware (mounting elements) providing for retention of side-plates and deflectionors, at bucket hub locations.

(b) Fasteners providing for structural assembly.

For these items, two cases should be considered :

. Accessible fastening items

. Inaccessible fastening items

Case of the accessible fastening items.

The deterioration of these items is unacceptable.

Renew them as instructed in chapter "REPAIR" of the Overhaul Manual.

Case of the inaccessible fastening items.

The acceptance limits concerning the loss of these items will be issued later.

C. Acceptable damage affecting the bucket dimensional characteristics.

The bucket dimensional characteristics must comply with the following :

(1) Bucket hinge center-to-center distance, (dimension "M")

This distance shall be comprised between 1256,6 and 1258,6 mm (49.473 - 49.552 in.).

Beyond these limits, report the Repair Engineering Dept. Product Support of SNECMA.

REPAIR

1. Format of the repair schemes

Each repair scheme (REP) describes only one operation to be carried out on a single part.

A. Repair scheme identification and classification

Any one part is identified by :

- its nomenclature
- its classification in the Illustrated Parts List (Figure-Item)

A repair scheme is identified by :

- the part to which it relates
- the purpose of this repair

These various criteria have been used for identification and classification purposes.

(1) Identification

The identification of a repair scheme is given by :

- the nomenclature of the part with its IPL reference No. (Figure-Item)
- the purpose of the repair preceded by its numerical order

(2) Classification

The classification of a repair scheme is given by :

- the A.T.A. breakdown system
- the number of the repair scheme which is given by :
 - (a) The part IPL classification (Figure-Item) and the repair numerical order.
- the page number, proper to any repair scheme (re-starts from page 401 for each repair scheme)
- the date

(3) Sample of identification and classification

NOMENCLATURE OF THE PART

IPL PART CLASSIFICATION

- 11 : FIGURE No.
- 320 : ITEM

MOBILE ASSEMBLY (11-320)

1. Renewal of the crimped nuts

PURPOSE OF THE REPAIR

REPAIR SCHEME No.

REP No. :

- REP = IPL FIGURE No. WHERE THE PART IS SHOWN
- 320 = PART ITEM No. ON FIGURE
- 1 = REPAIR SCHEME No.

MK.610-14-28
OVERHAUL

NOTE : The REP numbering system uses the repair scheme identification criteria in order to establish the direct identification/classification relationship.

(4) Particular case

(a) Identical parts

When n identical parts are installed on a same assembly, the numbering of the REP will be made by using the IPL classification of the first part.

Example :

Identification of the
thrust reverser cascades : CASCADE (2-10, 11, 30, 31,
50, 51, 70, 90, 110, 111,
130, 150, 170, 190)

REP No. : REP. 2-10-1

(b) Optional parts

In the case of the I.P.L. making mention of optional parts (OPT TO ...) and should these parts require a special repair scheme, the said scheme shall be identified as follows :

- the nomenclature of the part with its IPL reference No. (Figure - Item) of the basic part (and, if required, the manufacturer's part number),
- the purpose of the repair preceded by its numerical order number,
and classified as follows :
- A.T.A., breakdown system,
- the number of the repair scheme which is given by the IPL classification of the basic part (Figure - Item) and the repair scheme numerical order number followed by an alphabetical variant,
- page numbered 401 and onward,
- the date.

OVERHAUL

2. Updating

- A. The revisions, entailed by the technical evolution of the repair scheme, will affect its classification only as far as the date is concerned.

- B. Modification of the alternate part

An alpha variant is introduced in the IPL and modifies the figure-item No.

- (1) This modification has no effect on the repair scheme :
- the REP remains unchanged
- (2) This modification introduces a new REP :

Elaboration of a new repair scheme in which appears the alpha variant issue letter introducing this new REP.

Example : The modification introduces a REP with issue letter C, the previous REP is valid for the parts A and B.

REP 4-20-3 : valid for alpha variant A and B

REP 4-20C-3: valid from alpha variant C.

TEMPORARY
REVISION**

BRITISH AIRWAYS

CONCORDE OLYMPUS 593
OVERHAUL MANUAL

TR Page 1 of 1
21 September 1993

THIS TEMPORARY REVISION IS ISSUED BY BRITISH AIRWAYS TECHNICAL SERVICES AND COMPLIES WITH BCAR'S CHAPTER A5-3, B5-3 AND/OR TSS No. 0-2 AS REQUIRED. CAA DESIGN APPROVAL No. DAI/8566/78.

FOR CHIEF ENGINEER TECHNICAL SERVICES

TEMPORARY REVISION NO. 78-533

Manual Reference 78-31-01 REPAIR PARTS LIST Page 401

REASON FOR REVISION

1. To include List of British Airways Repair Schemes.
2. Re-issued to align with manufacturers Revision No. 22.

ACTION

The following B.A. Repair Schemes are applicable to this manual. Copies may be obtained from the Drawings Library, G.5, T.B.A.

CAUTION: IF MORE THAN ONE REPAIR IS APPLIED TO AN ASSEMBLY OR COMPONENT, THE COMBINED REPAIRS MAY CONSTITUTE AN UNACCEPTABLE STANDARD. WHERE DOUBT EXISTS THE APPROPRIATE TECHNICAL SERVICES SECTION MUST BE CONTACTED.

R.S. NO

DEFECT/TYPE OF REPAIR

78-41883

Seal segments, seal supports, shims
and bucket stops - wear - weld fill.

REPAIR

SCREW (1-10)

1. Restoring the silverplating

PARTS REQUIRED FOR REPAIR

- A. Restore the silverplating on the screw thread by Method M 303 B b) as described in Chapter 70-15-30 : "SURFACE TREATMENTS", as shown in figure 401, and additionally instructed in the following :
- (1) Remove the original plating by Method M 109 A described in Chapter 70-50-20 "CLEANING AND REMOVAL OF SURFACE COATINGS".
 - (2) Test for cracks by the post-emulsifying fluorescent penetrant procedure, Method M 504 B in Chapter 70-20-10 "DYE PENETRANT INSPECTION".

REPAIR

SCREW (1-10)

1. Restoring the metallizing

PARTS REQUIRED FOR REPAIR

Chromium carbide powder (P 3202)

- A. Restore the metallizing as instructed in Chapter 70-65-20 "SPRAY-COATING BY PLASMA TORCH", in figure 401, and in the following :
- (1) Remove the existing metallic coat by sandblasting, as instructed in Chapter 70-65-20 "SPRAY-COATING BY PLASMA TORCH".
 - (2) Check for cracks by the post-emulsifying fluorescent penetrant procedure, Method 504 B, described in Chapter 70-20-10 "DYE PENETRANT INSPECTION".
 - (3) Spraying powder : P 3202.
 - (4) Test pieces for stamping tests and metallographic inspection are from sheeting P 3328, 1,2 mm (0.047 in.) in thickness, while control test-pieces from sheeting P 3328, 4 mm (0.157 in.) in thickness.
- B. Inspect the metal coating as instructed in Chapter 70-65-80 "INSPECTION OF COATINGS".

OVERHAUL

REPAIR

THREADED SLEEVE (1-20)

1. Reconditioning of metallic plating

PARTS REQUIRED FOR REPAIR

Metallic powder P 3202

A. Removal of coating

Remove the existing defective coating by sand blasting as indicated in chapter 70-65-20.

B. Inspection

Carry out a soundness inspection with post-emulsification fluorescent dye penetrant, using method M 504 B of chapter 70-20-10.

If cracked, scrap the part.

C. Reconditioning the coating

(1) Plug the 2-off 3,175 mm (0.125 in) dia. holes, and the 7,938 mm (0.3125 in) dia. bore to avoid any possible metallization in these areas.

(2) Apply the metallic coating as per instructions in chapter 70-65-20 and figure 401.

Metallic powder : P 3202

Coating thickness : 0,1 to 0,2 mm (0.004 to 0.008 in)

D. Inspection

(1) Check the coating quality as per instructions in chapter 70-65-80 and figure 401.

2. Reconditioning of silver plating

PARTS REQUIRED FOR REPAIR

A. Recondition the silver plating, as indicated below, and using process M 303 B (b) of chapter 70-15-30, as indicated on figure 401.

- (1) Remove the existing plating using process M 109 B.
- (2) Crack-test with post-emulsification fluorescent-dye penetrant using process M 504 B of chapter 70-20-10.
If cracked, scrap the part.
- (3) Plating thickness : 0,007 to 0,015 mm (0.0003 to 0.0006 in).

REPAIR

PRIMARY HEAT SHIELD (1-30)

2. Plasma-Spray repair of leading, trailing and side edges

PARTS REQUIRED FOR REPAIR

Metal powder	P	3203
Metal powder	P	3205

A. Removal of the coating

Remove the existing metal coating by sand blasting, as instructed in Chapter 70-65-20.

B. Soundness inspection

Crack test the blasted area with water washable fluorescent dye penetrant using method M 502 B in Chapter 70-20-10. If cracks are found, lay the part on one side, pending a switable repair scheme.

C. Reconditioning of the coating

NOTE : Prior to sandblasting, smooth out the contours with a fine emery cloth near the worm surfaces.

Spray the coating using a plasma torch as per instructions in chapter 70-65-20, and as indicated on figure 401 and below.

- (1) Spray a primer coat : P 3203
Coat thickness : 0,05 to 0,1 mm (0.0020 - 0.0040 in)
- (2) Spray a metal coat : P 3205
Coat thickness : 0,1 to 0,15 mm (0.0040 - 0.0060 in)

NOTE : The coating is left as sprayed.

D. Inspection of the metal coating

Check the adhesion and condition of the coating as per Chapter 70-65-80.

OLYMPUS 593

MK.610-14-28
OVERHAUL

Check that the thickness of the coating is correct.

If the coating is not satisfactory, recommence reconditioning.

E. Marking

- (1) Inscribe "REP 2" next after the part number, by Method M 28 described in Chapter 70-10-10.

3. Weld Build-up of Worm Surfaces at the Leading and Trailing Edges.

PARTS REQUIRED FOR REPAIR

A. Preparing the Part.

- (1) Smooth out worm surfaces with a fine emery cloth.
- (2) Clean the smoothed areas by wet sand-blasting as per method M103A in chapter 70-15-20.

B. Weld Build-up of Worm Areas.

- (1) Install copper heat dissipators on the face opposite the area to weld build-up.
- (2) Weld build-up the worm areas by argon arc-welding, using method described in chapter 70-35-10. Let the part cool down to ambient temperature between two runs.
 - (a) Filler metal: P3024 (NC20K14).
 - (b) Weld class: B2.

C. Honing of Weld Built-up Areas.

- (1) Straighten up distortions, if required.
- (2) Hone the weld built-up areas to the profile of the adjacent areas per figure 401.

D. Inspection of Welding.

- (1) Inspect B2 class welding on the weld built-up areas, as per chapter 70-35-80.
 - (a) Crack test with water washable fluorescent dye penetrant using method M502B in chapter 70-20-10.

REPAIR

SECONDARY HEAT SHIELD ASSEMBLY (1-40)

1. Replacement of the seal and/or the rivets

PARTS REQUIRED FOR REPAIR

Seal	No. 302-900-000-6	
Pop blind rivet	CR 2839-4-2	(649-772-192-0)

- A. Drill the original rivets out using a 2.8 mm drill bit (0.11 in. Dia.).
- B. Remove the damaged seal and recover the angle-irons and the riveting plate.
- C. Prepare the new seal as per figure 401.
- D. Position, then rebores the rivets passage holes in the angle-irons, the riveting plate and in the heat shield to 3.63-3.71 mm diameter (0.143-0.146 in. Dia.).
- E. Position the seal, the angle-irons and the riveting plate on the heat shield as per figure 401, then fasten the assembly using clamps.

NOTE: Spread the mesh of the metallic braid using a scribe so as to facilitate the installation of the attachment elements.

- F. Install the pop blind rivets as per chapter 70-50-50 of the Standard Practices Manual and figure 401, starting with the median axis of the heat shield and working toward the sides.
- G. Check the riveting as per chapter 70-50-85 of the Standard Practices Manual.

REPAIR

SECONDARY HEAT SHIELD ASSEMBLY (1-40)

2. Repair of Heat Insulation Sheeting by Means of Resistance Welded Patches

PARTS REQUIRED FOR REPAIR

Wafered sheet metal NC 15 Fe P3502 ; thickness 0,1 mm
(0.004 in.)
Plain sheet metal NC 15 Fe P3324 ; thickness 0,3 mm
(0.012 in.)
MIN "K" heat insulation material No. 302-061-500-0

A. General

Repair of local defects affecting the heat insulation metal sheeting is performed by cutting out the impaired areas and installing resistance welded patches. The design features of heat shields are such they necessitate that the patches be welded without removing the heat insulation. This can be performed using a welding equipment such as :

M10DZ010

BRONZAVIA AERONAUTIQUE
2, rue Jean Perrin
92000 NANTERRE - FRANCE

B. Conditions for installing patches

- (1) They are those specified in Chapter 70-35-20, "RESISTANCE WELDING".

C. Cutting-out item to be required.

- (1) This operation is to be carried out as instructed in Chapter 70-35-20, "RESISTANCE WELDING".

78-31-01

REP 1-40-2

Page 401

Jun 30/97

OLYMPUS 593

MK.610-14-28

OVERHAUL

- (2) Check the condition of MIN "K" heat insulation for any damage. The impaired portion must be replaced.

D. Producing the patches

- (1) These may be cut out of a sound section of heat insulation sheet salvaged from a discarded heat shield or out of a wafered sheet P3503.
- (2) Patch dimensions are dependent on the extent of damage. Their shapes must comply with the requirements stated in Chapter 70-35-20, "RESISTANCE WELDING".
- (3) Patches are to be cut out in such a way that they provide for a 10 mm (0.41 in.) min. overlap and that the corrugated pattern of patch fully matches that of heat shields.
- (4) If applicable, cut out a piece of MIN"K" heat insulation material so that it fits snugly in its recess.

E. Welding the patches

- (1) Fitting out and setting the welding equipment
 - (a) The welding gun must be fitted with an electrode whose tip is shaped as shown in Fig. 401. This shape prevents puncturing of the sheet during welding.
 - (b) Set the welding equipment using the manufacturer's "Instruction for Use" ; then check the settings by welding test-pieces.
- (2) Welding test on test-pieces.
 - (a) Prior to weld the patches it is necessary to weld a test-piece to "qualify" the selected settings.
 - (b) The welding test-piece is made of two 100 X 30 mm (3.95 X 1.20 in.) strips of wafered sheet P3503. Cleaning and welding of test-piece to be carried out in the same way as on part to be repaired. The test-piece must feature at least 5 spot welds.

PRINTED IN FRANCE

78-31-01

REP 1-40-2

Page 402

Apr 30/93

OLYMPUS 593

MK.610-14-28
OVERHAUL

- (c) Test-piece inspection is carried out by peeling off the spot welds.

The test-piece is deemed satisfactory when all spot welds are peeled off.

(3) Preparing the parts before welding

CAUTION : INSTALL A PROTECTIVE DEVICE TO PREVENT DAMAGE TO MIN"K" HEAT INSULATION DURING THE BUFFING OPERATION.

- (a) Perform a fine buffing of overlapping zones on both patch and heat shield.
- (b) Clean areas to be welded as instructed in Chapter 70-35-20 "RESISTANCE WELDING".

(4) Welding the patches

- (a) Sandwich the quartz wool neatly if required.

CAUTION : A POOR CONTACT RESULTS IN EXCESSIVE WELDING PRESSURE WHICH, IN TURN, CAUSES PUNCTURING OF SHEETS.

- (b) Ensure perfect contact of areas to be welded.
- (c) Stitch weld the patch (Ref. Fig. 401).

NOTE : Work with the flat at the tip of electrode. Connect the current return clamp as close as possible the welding zone.

F. Inspection

- (1) Check the part visually for freedom from burn or sheet puncturing.

REPAIR

SIDE PLATE ASSY (1-50) and (1-110)1. Renewal of "Heli-Coil" thread inserts

PARTS REQUIRED FOR REPAIR

or	Heli-coil insert	No. 3591-4 TNV0250	(649-773-189-0)
	OTALU insert	No. 01324747004	(649-061-611-0)
	Heli-coil insert	No. 1191-6 TNV0562	(649-773-255-0)
	Bush	No. 301-085-100-0	

A. Removal

- (1) Extract the damaged inserts using the manufacturers extractor.

NOTE : For inserts identified "O" (Section AA), the bushes must be removed by machining, before removing the inserts.

B. Inspection

- (1) Check the condition and cleanliness of the thread insert housing holes.

If any burrs are found, remove these using the manufacturers "finishing" tap.

C. Assembly

- (1) Fit a new thread insert using the manufacturers threaded mandrel, as shown on figure 401.
- (2) Break the driver using the manufacturers special tool.
- (3) Refit the bushes, with a press, at positions marked O (see section AA).

D. Inspection

- (1) Check that the thread insert is correctly fitted.

- (c) If necessary, ream the rivet holes in the washers and in the reinforcing plates to the next greater diameter as indicated in figure 401.

(2) Fitting rivets

- (a) Fit the new rivets, with diameters appropriate to the holes, as indicated on figure 401 and in chapter 70-50-10.
- (b) Fit load spreading washers to all rivets, except those marked (O), and proceed as follows :
- (i) Apply a force of 45 daN.m (100 lbf) to the washer, and weld it to the rivet as indicated on figure 401, and as per instructions in chapter 70-35-10
- Weld filler wire P 3030
Weld class B1
- (ii) Flush the welds off level with the load spreading washer
- (iii) Inspect the welds as per instructions in chapter 70-35-80

NOTE : The crack test is to be carried out with water-washable fluorescent dye penetrant using process M 502 B in chapter 70-20-10.

- (c) Inspect the rivetting as per chapter 70-50-80 and figure 401.

B. Renewal of reinforcing plates

(1) Removal of defective plates

- (a) Remove the reinforcing plates by grinding away the retaining rivet heads (O) and by drilling the other rivets, on the welded washer side.
- (b) Check that the rivet holes in the stressskin panels are not oval.
- If they are oval, round off the edges of the holes.

(2) Fitting the reinforcing plate

- (a) Position the new reinforcing plate on the side plate such that the radiused face is against the stressskin panel, as shown on figure 401. Mark the

positions of the bolt and rivet holes.

- (b) Remove the reinforcing plate from the side plate assembly. Drill the bolt and rivet holes as shown on figure 401 and as per instructions in chapter 70-50-10.

NOTE : The holes are to be drilled perpendicular to the inner face of the side plate.

- (c) Position the reinforcing plate, and rivet it as indicated on figure 401, and as per instructions in paragraph A of this repair scheme (REP).

Reinforcement plates	No. 301-140-500-0 and No. 301-140-550-0
Bar for bushing	: P3621
Weld filler wire	: P3026

A. Introduction.

- (1) This repair scheme gives the information required to renew the inserts.
- (2) For heli-coil inserts renewal, refer to REP 1-50-1.
- (3) To renew inserts which require removal of the reinforcing plates, refer to REP 1-50-2 for the methods of removal and reinstallation.

B. Working Procedure.

- (1) Removal of the damaged insert

78-31-01

REP 1-50-3

Page 401

Apr 15/87

OLYMPUS 593

MK. 610-14-28

OVERHAUL

sneema

- (a) If required, remove the internal reinforcing plates from the side plate, as per instructions in REP 1-50-2 in the chapter 78-31-01.
- (b) Remove the insert by grinding the flared section for crimped inserts or the weld bead if the inserts are welded, as indicated on figure 401.

CAUTION: PROTECT THE STRESSKIN PANEL, TO AVOID ANY DAMAGE OR BURNING DURING GRINDING.

(2) Preparation of the parts

- (a) Dependent on the type of insert to renew, produce a sleeve as per instructions on figure 402.
- (b) Rework the inserts and washers 649-773-XXX-0 as indicated on figure 403.

(3) Fitting the insert

- (a) In the location at which the inserts is to be fitted, drill a hole to install the sleeve.
 - 1) The hole is drilled by mean of a spot-facing milling cutter complete with pilot tip, as described in chapter 70-30-10, and shown in figure 404.
- (b) After machining, carry out a water-washable fluorescent dye penetrant check for cracks, using method M 502 B given in the "DYE PENETRANT CHECK" chapter, para. 70-20-10.

No cracks are acceptable. If cracks are found, place the part aside pending a repair scheme.

- (c) Mount the bush as follows:

78-31-01

REP 1-50-3
Page 402
Jun 30/97

OLYMPUS 593

MK.610-14-28

OVERHAUL

1 Fit the bush, ascertaining that its centreline is perpendicular to the tangent plane of the sideplate.

2 Tack-weld, then argon arc-weld the bushing onto the sideplate, as instructed in chapters 70-30-10 and 70-35-10.

a Weld filler wire : P3026

b Weld class : B1

NOTE : The sideplate should be purged with argon for 1 hour prior to welding.
Use cooling blocks to protect the panel about the bush.

3 Carry out a Class B1 soundness test as described in chapter 70-35-80.

NOTE : Localized water-washable dye penetrant inspection as per M 501 B in chapter 70-20-10.

4 Machine-flush the weld bead to the contour of the dimpling.

(d) Install the insert, and depending on the type, either crimp it using tool SC 253 or weld it as indicated on figure 405.

For the welded insert : B1 class weld. Weld filler wire : P3026.

(e) Check the installation of the insert.

1 Make sure that the crimped inserts do not go round or swing to and fro in their recesses.

2 Perform a Class B1 weld soundness test on the welded inserts, following instructions in chapter 70-35-80.

OLYMPUS 593

MK.610-14-28
OVERHAUL

NOTE : Localized water-washable dye penetrant inspection as per M 501B in chapter 70-20-10.

(4) Reassembly of the various elements

- (a) If required, refit the internal reinforcing plates to the side plate as per instructions in REP 1-50-2.
- (b) If required, refit the heli-coil inserts, as per instructions in REP 1-50-1.
- (c) Press fit sleeves at locations marked " + " (See section D-D, figure 405).

REPAIR

SIDE PLATE ASSEMBLY (1-50/110)

4. Repair of Cracks by Weld-Filling

PARTS REQUIRED FOR REPAIR

Weld filler wire P3026
Silicone elastomer CAF4 (P 474)

A. Repair of cracks developing in the parent metal, or in existing weld beads.

- (1) Monitor the condition of the crack surround, ascertaining by a sound test made with a metal object, that there is no delamination. If there is, this repair scheme is unsuitable for use.
- (2) Accurately demarcate the crack on careful scrutiny with a X 20 twin-lens magnifier, then drill a 1 mm (0.039 in.) dia. hole at its either end.
- (3) Weld-fill the crack by the argon arc process adhering to the instructions in Chapter "PRINCIPLE OF REPAIRING COMPONENTS MADE FROM WELDED HONEYCOMB STRUCTURE" Section 70-30-10, and in Chapter "WELDING", Section 70-35-10.

Filler metal: P3026
Weld Class B1

NOTE: It is essential in welding to apply copper cooling (heat sink) blocks as close to the weld as possible.

- (4) Check the Class B1 weld as instructed in Chapter "WELDING", Section 70-35-80, and in the following:

Perform a water-washable dye penetrant test by Method M501B as described in Chapter 70-20-10.

78-31-01

REP 1-50-4

Page 401

OLYMPUS 593

MK.610-14-28

OVERHAUL

CAUTION: THE PENETRANT IS TO BE CLEARED OUT USING A CLOTH SOAKED WITH ISOPROPYL ALCOHOL (P442).

- (5) Ascertain that the segment under repair is free from delamination by a sound test made with a metal object.
- B. Repair of cracks developing from an attachment hole or propagating under a reinforcement plate.
- (1) Remove reinforcement plates under which cracks have propagated, per REP 1-50-2 or, when inserts are concerned, per REP 1-50-3.
 - (2) Prior to repair, ascertain, by a sound test made with a metal object, that the area surrounding the crack is free from delamination.
 - (3) The instructions for weld-filling the crack are the same as those under A.
 - (4) Seal the hole edges with elastomer CAF4 by Method M701 described in Chapter "APPLICATION OF RESINS AND ELASTOMERS", Section 70-31-20.

NOTE: While elastomer is polymerizing, insert a pin of the same diameter as the insert or rivet to be replaced, previously coated with tetrafluorethylene, so as to hold the elastomer in position.

- (5) Reinstall parts removed in step B.(1) per REP 1-50-2 and/or REP 1-50-3.

3. Refurbishing the location diameter by nickel plating

PARTS REQUIRED FOR REPAIR

-
- A. Smoothen the location diameter by machining. This machining to be the minimum necessary to just remove any defects, and to give a minimum re-plating thickness of 0,05 mm (0.0020 in.).
 - B. Carry out a crack test with post emulsification fluorescent dye penetrant, using process M 504 B in chapter 70-20-10.
If cracked, scrap the part.
 - C. Nickel-plate the locating diameter using process M 301 B (b) in chapter 70-15-30, as indicated below and in figure 401.

(1) Plating thickness: 0,127 mm (0.005 in.) minimum
 - D. Rework the location diameter by machining to the dimensions of figure 401.

REPAIR

SPHERICAL BEARING (1-350)

2. Reconditioning the spherical diameter chrome plating

PARTS REQUIRED FOR REPAIR

- A. Remove the existing plating and any damage marks by grinding, taking care, however, not to exceed the limits given on figure 401.
- B. Crack test with post emulsification fluorescent dye penetrant using process M 504 B in chapter 70-20-10.

If cracked, scrap the part.
- C. Recondition the spherical diameter chrome plating using process M 300 B (b) in chapter 70-15-30, as indicated below and on figure 401.

(1) Plating thickness: 0,25 mm (0.010 in.) minimum.
- D. Correct, by grinding, the spherical diameter to obtain the value given on figure 401.
- E. Carry out a crack test with post emulsification fluorescent dye penetrant using process M 504 B in chapter 70-20-10.

(1) The presence of a fine hairline cracks network caused by the original machining (by grinding) is normal.

(2) The presence of pits, excessive cracks, blisters or flaking or all other detrimental defects is not acceptable and involves re-application of the repair.

BASIC BUCKET UNIT (1-460)

1. Renewal of Heli-coil thread inserts fitted in the primary heat shield attachment points :

PARTS REQUIRED FOR REPAIR

Heli-coil thread insert No. 3591-6TNV-0375

A. Removal of the existing thread insert

- (1) Remove the damaged thread insert using the manufacturers extractor.

B. Inspection

- (1) Check the condition and cleanliness of the Heli-coil insert housing thread.

If any burrs are present, rework the thread using the manufacturers "finishing" tap (thread 3/8 - 24 Heli-coil, class 3B).

C. Fitting the new thread insert

- (1) Fit the thread insert using the manufacturers threaded mandrel as indicated on figure 401.
- (2) Break off the drive with the special tool.

D. Inspection

- (1) Check that the thread insert is correctly fitted.

Rivet	No. MS 20427 M3-5 (650-022-044-0)

A. Renewal of Blind Nuts(1) Removal of defective blind nuts

Remove the nut by drilling with a 7.5 mm (0.295 in) dia. bit.

NOTE : As far as possible, remove any swarf which falls into the cell.

(2) Fitting a new nut

Fit the blind nut using the manufacturer's assembly tool as indicated on figure 401, and the manufacturer's instructions.

NOTE : Carefully respect the position of the anti-rotation lug.

(3) Inspection

- (a) Check that the nut is correctly crimped and that the thread has not been damaged in any way during assembly.
Otherwise, replace the nut.

Manual Reference 78-31-01 REP 1-460-2 Page 402

REASON FOR REVISION

Ground Occurrence Report (E1022) - Anchor Nut part number 301-084-800-0 fell out during transit from Workshops, via Stores to Hangar.

ACTION

Reference Para 2.C. Renewal of Thread Inserts

Sub Para. (3) is REVISED to read as follows:-

- (3) Fit a new thread insert using the manufacturers threaded mandril as shown in figure 402 - Sections AA, DD, EE.

NOTE: Nut Pt.No. 301-084-800-0 (Section EE) should be press fitted using Loctite 640, in accordance with the relevant Standard Practices Manual.

In the case of nut Pt. No. 301-084-600-0 (Section CC), it is necessary to use an installation sleeve to enable the new thread insert to be fitted.

OVERHAUL

- (b) Check that the adjustment washers are flush with the bucket hub over their full width.

- Gap to be filled = 0.25 mm (0.010 in).

B. Renewal of Captive Nuts

(1) Removal of damaged nuts

Remove the nut by grinding away the heads of the retaining rivets.

(2) Fitting a new nut

Fit a new nut by rivetting as per instructions in "RIVETING" chapter 70-50-10, and as indicated on figure 402 - sections AA and BB.

(3) Inspection

Check that the nut is correctly rivetted as per chapter 70-50-80 "RIVETING".

C. Renewal of Thread Inserts

NOTE : In the case of thread insert fitted in nut No. 301-084-800-0 (figure 402 - section EE), it is necessary to remove the nut from the hub to renew the thread insert.

- (1) Remove the existing thread insert using the manufacturer's extractor.

- (2) Check the cleanliness and condition of the tapping for the thread insert.
If any burrs are found, remove them using the manufacturer's "finishing" tap.

- (3) Fit a new thread insert using the manufacturer's threaded mandril as shown in figure 402 - Sections AA, DD, EE.

NOTE : In the case of nut 301-084-600-0 (section CC), it is necessary to use an installation sleeve to enable the new thread insert to be fitted.

- (4) Break off the drive using the manufacturer's special tool.

Tab nut	NAS686C3	(649-785-086-0)
	NAS1068C3	(649-785-128-0)

A. Determining the leading-edge cover position on the bucket.

- (1) Anchor positioning tools SC 271 in the retaining holes on the heat shields.
- (2) Position the tools relative to the damaged cover and lock the stops (see figure 401, sheet 2 of 3).
- (3) Take down the tools.

B. Disassembly of damaged cover.

- (1) Remove cover fasteners as instructed in Standard Practices, chapter : 70-50-50 for blind rivets
70-50-60 for blind bolts.

C. Inspection

- (1) Make a soundness inspection of the tab nuts and, if necessary, remove any damaged nuts by grinding out the rivet heads as shown in figure 401, and instructed in chapters 70-50-10 and 70-50-50.

78-31-01

D. New cover drilling

- (1) If necessary, correct the shape of the new cover, matching it to the contour of the bucket.
- (2) Stick a strip of stabylene tracing paper onto the bucket to transfer-mark the locations of holes "A" and "B" (See sheet 3 of 3).
- (3) Put the new cover in position on the structure as shown in figure 401, and by the following mode of procedure.
 - (a) Put the new cover in position on the bucket.
 - (b) Remount the tools onto the bucket.
 - (c) Position the cover relative to the tools.
 - (d) Drill 5 pilot holes 3,25 mm (0.128 in.) dia, subsequently to be used for securing the cover, based on the existing holes in the outer panel.

NOTE: Allot the pilot holes over the entire length of the cover.

- (e) Put on clips, and press the cover tight against the tools.
- (4) Drill the holes marked "C" as shown in figure 401, and as follows:

NOTE: When drilling, start with the hole nearest the axis of symmetry, proceeding towards the sides by drilling alternately on either side of the axis.

- (a) Drill 3,25 mm (0.128 in.) dia. pilot holes on the basis of the panel holes. Clip as you go along.
 - (b) Check the alignment of the holes and if necessary rework lengthwise.
 - (c) Rebore the pilot holes to the "finished" value as indicated in figure 401.

sneema

- (5) Remove the cover as follows:
 - (a) Stick stabylene tracing paper on the cover.
 - (b) Remove the tools.
 - (c) Take off the clips, and remove the cover.
- (6) Drill the holes marked "A" and "B" as shown in figure 401, and as follows:
 - (a) Mark out and drill 3,25 mm (0.128 in.) dia. pilot holes as traced out on the tracing paper.
 - (b) Check the alignment by means of stabylene and, where necessary, rectify working lengthwise.
 - (c) Rebore to the "finished" dimension as shown in figure 401.
- (7) Deburr all the holes with fine buckskin.
- (8) Adjust and cut out the cover as indicated in figure 402 and as follows:
 - (a) Position and clip fasten the cover on the bucket.
 - (b) Use a scriber to trace out the contours of the cover, as shown in figure 402.

NOTE: Press the cover firmly against the nut support cornerplate.

 - (c) Remove and cut out the cover, set back 2 mm (0.078 in.) from the scribed tracing-line.
 - (d) Thoroughly deburr along the cutout.

E. Mounting the tab nuts.

- (1) Position new nuts to the support corner plate as shown in figure 401.

sneema

- (2) Install the retaining rivets as instructed in chapters 70-50-10 and 70-50-50 in Standard Practices.
- (3) Check the riveting as indicated in chapters 70-50-81 and 70-50-85.

F. Mounting the new cover.

- (1) Position and clip fasten the cover on the bucket.
- (2) Mount the fasteners as shown in figure 401 and described in chapters 70-50-50 and 70-50-60.

NOTE: When fitting PLT type blind bolts, start with the hole nearest the centreline (after removal of the clip), proceeding towards the sides by alternately applying one to the left and one to the right of it.

- (3) Check the way the fasteners have been installed by consulting:
 - (a) Chapter 70-50-85 for blind rivets.
 - (b) Chapter 70-50-86 and figure 401 for blind bolts.

Rivet NAS 1199-5-8	(650-024-106-0)

A. Renewing the shims (figure 401, sheet 3 of 6)

NOTE : Prior to removing damaged shims, mark the relative positions of chamfers to the bucket structure.

- (1) Remove rivets by drilling out the heads on the shim side. Remove the shims, guarding against mislaying the bushes.
- (2) Check that the bushes are firmly seated on the doubler after disassembly.
- (3) Put shims in position on the buckets, and do the riveting as instructed in Standard Practices, chapter 70-50-10 (see section A-A on sheet 3 for layout).

78-31-01

REP 1-460-5

Page 401

MK.610-14-28

OVERHAUL

- (4) Machine the snapped parts of the rivets fully flush with the shims.
- (5) Check the riveting as instructed in Standard Practices, chapter 70-50-81.

B. Renewing the seal supports (figure 401, sheets 3 and 4)

- (1) Remove the retaining rivets by drilling out the countersunk rivet heads on the support side, then dismount the damaged supports.

NOTE : After removal of the rivets, insert pins into the retaining holes to keep the shims between the skin panels from shifting and avoid the loss of bushes.

- (2) Check that the bushes are firmly seated on the doubler after disassembly.
- (3) Drill the new supports as indicated in figure 401, and as follows :
 - (a) On the new seal support, trace out and drill a hole, marked "C", in the thickest portion, as shown on sheet 6. Deburr.
 - (b) Scribe the centreline of the other "C" holes.
 - (c) Position, and clip on the seal support along the centreline scribed. Keep in position with adhesive tape (see figure 401, sheets 3 and 6).
 - (d) Counterdrill 3,25 mm (0.128 in.) dia. pilot holes in line with the other "C" holes to register with the existing holes in the bushes.

NOTE : Be careful not to damage the bushes, and be sure to drill perpendicularly.

- (e) Check the alignment of the holes, and rectify, if necessary, by working lengthwise.
- (f) Remove the new sealing support.
- (g) Drill the "C" holes to the "finished" dimension, and make the countersinks as shown in figure 401, sheet 6.

78-31-01

REP 1-460-5

Page 402

OLYMPUS 593

MK.610-14-28

OVERHAUL

(h) Thoroughly deburr the holes.

(4) Secure the seal supports as instructed in Standard Practices, chapter 70-50-10, and hereunder :

- 1 Supports on buckets 3511 to 3574 should be fastened with rivets NAS 1199-5-11 and washers 650-355-013-0.
- 2 Those on buckets 3575 and on, with rivets NAS 1198-5-13 (for layout see the two A-A sections on sheet 3).

(5) Machine the snapped parts of rivets fully flush with the support.

(6) Check the riveting as instructed in Standard Practices chapter 70-50-81.

C. Replacing the bucket stops (see figure 401, sheet 4).

(1) Remove the retaining rivets by grinding out their countersunk heads. Remove the stops.

NOTE : Be careful not to damage the countersunk holes in the inserts or in the heat-shield back-up plates.

(2) Put the new stop in position on the bucket as shown in figure 401, sheet 4. Clip it in position at point "E" and hold fast by the use of clamps.

(3) Drill holes marked "A", "B" and "D", as shown in figure 401, sheets 4 and 6, and as follows :

- (a) Counterdrill 3,25 mm (0.128 in.) dia. pilot holes brought into relation with the inserts. Clip as you go along.
- (b) Check the alignment of the pilot holes, and rectify, if necessary, by working lengthwise.
- (c) Remove the stop.

78-31-01

REP 1-460-5

Page 403

Aug 31/79

- (d) Drill to the "finished" dimension, and counter-sink the "B" holes as shown in figure 401, sheets 4 and 6. Deburr.
 - (4) Mount the new stops on the bucket as shown in figure 401, sheet 4, and as follows :
 - (a) Position the bucket stop.
 - (b) Mount the fasteners as shown in figure 401, sheet 4, and described in chapter 70-50-10.
- NOTE : Mind the way the rivet is applied.
Preformed head into insert countersink.
- (c) Machine the rivets flush with the stops, back-up plates and inserts.

(5) Check the riveting as instructed in chapter 70-50-81.

D. Renewing the back-up plates

- (1) Take-off the damaged back-up plates, removing the fasteners by drilling out the rivets on the back-up plate side, as shown in figure 401, sheets 4 and 5.
- (2) Check the plasma sprayed strip on the outer panel for soundness.

In case of flaking or injury, restore the plasma spray-coat as instructed in REP 1-460-12 in this chapter 78-31-01.

- (3) Put the heat-shield back-plates in position on the bucket, as shown in figure 401, sheet 5 and as follows :
 - (a) Mark out the centreline of "A" holes on the face in contact with the panel.
 - (b) Put the heat-shield back-up plates in place.
 - (c) Hold in position by adhesive tape and clamping.

OLYMPUS 593

MK.610-14-28

OVERHAUL

- (4) Drill the "A" holes into the new back-up plates as follows :

NOTE : When counterdrilling, start with the hole nearest the axis of symmetry, proceeding towards the sides by drilling alternately left and right of the axis.
Put clips as you go along.

- (a) Counterdrill 3,25 mm (0.128 in.) dia. pilot holes, following the inserts.
 - (b) Check the alignment of the pilot holes and rectify as necessary by working lengthwise.
 - (c) Remove the heat-shield back-up plates.
 - (d) Drill the "A" holes to the "finished" diameter, and countersink as shown in figure 401, sheet 6.
 - (e) Thoroughly deburr the holes.
- (5) Mount the back-up plates on the bucket as indicated in figure 401, and as follows :
- (a) Position the plates, and clip-fasten 1 hole out of 4.
 - (b) Mount the fasteners as shown in figure 401, sheet 5 and instructed in chapter 70-50-10.

NOTE : Mind the way the rivets are applied.
Preformed heads into inserts.

- (c) Machine the rivet heads flush with the back-up plates and inserts.
- (6) Check the riveting as instructed in chapter 70-50-81.

A. Introduction.

This repair scheme offers all requisite particulars on how to apply doublers. It is only applicable where the width of the damaged area falls within the permissible limits (see Fig. 402).

Remove the front-frame leading edge cover; if it is damaged, make sure it is replaced as instructed under REP 1-460-4.

78-31-01

REP 1-460-6

Page 401

Aug 31/79

OLYMPUS 593

MK.610-14-28

OVERHAUL

B. Radiographic Inspection.

Carry out an X-ray inspection of the extent of damage in the outer panel, using an X-ray unit complete with a long anode, as instructed in Chapter 70-20-30, and shown in Fig. 401.

C. Panel Cut-out.

Remove the damaged segment from the panel as follows :

- (1) Remove the panel fasteners from the frames in and around the damaged area, as shown in Fig. 405 and instructed in REP 1-460-3 and Chapter 70-50-60.
- (2) Cut the damaged segment out of the panel, as indicated in Fig. 402 and instructed in Chapter 70-30-10

NOTE : The cut may be made slightly aslant so as to meet the requirements indicated in Fig. 401.

- (3) Blank off the cavities in the outer panel, as indicated in Fig. 402, and by the following procedure :
 - (a) Clean the welding area thoroughly with a pad steeped in isopropyl alcohol (P442). Repeat several times if necessary until the area involved is perfectly free from any grease.
 - (b) Cut a closeout strip from the strip steel (P3305) in a thickness of 0,6 mm (0.023 in.), a length according to need, and a 7,9 mm (0.311 in.) width. Adjust this strip to the outline of the cut-out.
 - (c) Put the closeout strip in position, and argon arc-weld it to the edge of the panel as described in Chapter 70-35-10
 - Weld filler wire P3008 (Z8 CND 15)
 - Weld class B1

78-31-01

REP 1-460-6

Page 402

Aug 31/79

OLYMPUS 593

MK.610-14-28

OVERHAUL

NOTE : When welding, it is essential to apply copper cooling blocks as close to the weld as possible.

CAUTION : THE PENETRANT IS TO BE CLEARED OUT WITH A SWAB SOAKED WITH ISOPROPYL ALCOHOL (P442).

(d) Carry out a Class B1 weld inspection as instructed in Standard Practices, Chapter 70-35-80, and by the procedure below :

- Water washable dye penetrant inspection, Method M 501 B in Chapter 70-20-10.

D. Soundness Inspection of Frames.

- (1) Perform a soundness inspection of the frames in the damaged area and around the angle-plate fasteners by the water-washable dye penetrant procedure, Method M 501 B, Chapter 70-20-10.
- (2) If no cracks show up, smooth off scratches by sandpapering.
- (3) If there are cracks, repair the frames with welded-on or riveted patches as instructed under E. and F. below.

E. Repairing Frames with Welded-on Angle-plate Patches.

NOTE : This form of repair is applied to the front frame and the first frame.

- (1) Remove the angle-plate connecting-pieces in the front frame and the first frame, as shown in Fig. 405.
- (2) Cut-out the damaged angle-plate segment, as shown in Figs. 403 and 404. Deburr.
- (3) Repair the frames with welded-on patches, proceeding as follows :
 - (a) Using P3305 metal sheet (Z8 CND 15) of 1,27 mm (0.050 in.) thickness for the front frame and 1,6 mm (0.063 in.) for the first frame, make up angle-plate segments "1" and "2" as shown in Figs. 403 and 408.

78-31-01

REP 1-460-6

Page 403

Aug 31/79

- (b) Put the angle-plate patch in position and argon arc weld it on, as instructed in Chapter 70-35-10 and indicated in Fig. 402
- Weld filler wire P3008 (Z8 CND 15)
 - Class of weld B1

If necessary, machine the weld flush on the face coming into contact with the support angle-plates.

- (c) Check for Class B weld as instructed in Chapter 70-35-80, and by the procedure below :
- Water washable dye penetrant inspection, Method M 501 B, Chapter 70-20-10.

- (4) Counterdrill the holes marked "D" as indicated in Fig. 405.
- (5) Mark out and drill pilot holes of 3,25 mm (0.128 in.) dia. in the locations marked "A" on the front frame.

F. Repairing the First Frame with Riveted Angle-plate Patches

- (1) Remove the connecting-pieces from the angle-plates in the first frame, as shown in Fig. 405.
- (2) Cut out the damaged angle-plate segment as indicated in Fig. 404.
- (3) Make up the angle-plate patch from P3305 metal sheet (Z8 CND 15) as shown in Figs. 404 and 408.

NOTE : There are two alternative modes of securing the patch to the existing angle-plate (see Fig. 404).

- (4) Put, and keep, the patch in position on the frame. Drill the patch and rivet it to the existing angle-plate, using CR 2839 and CR 2838-4 rivets, and following the guidance in Fig. 404 and Chapter 70-50-50.

OLYMPUS 593

MK.610-14-28

OVERHAUL

(5) Counterdrill the holes marked "D" as shown in figs. 404 and 405.

(6) Check the riveting as described in Chapter 70-50-85.

G. Applying Reinforcement Angle-plate "6" to the Front Frame.

NOTE : The instructions that follow are only relevant to a front frame repaired as described in Para. E above. Otherwise the need for an angle "6" can be dispensed with, and the use of a 3,5 mm (0.138 in.) thick spacer will do.

(1) Reinforcing angle-plate "6" and spacer "8" are made up as follows :

(a) Tailor angle-plate "6" from P3344 metal sheet of 1 mm (0.039 in.) thickness, as instructed in Fig. 408, Sheet 5.

(b) Cut out spacer "8" from 2,5 mm (0.10 in.) thick metal sheet in the size given in Fig. 405, Sheet 4.

(2) Mount the reinforcement angle and the spacer on the frame as follows :

(a) Stick a strip of STABILENE tracing-paper on the front frame. Mark the locations of the "A" holes. Put angle-plate "6" in position on the frame, stick the STABILENE on the angle-plate, and take down.

(b) Drill mark and drill out 3,25 mm (0.128 in.) dia. pilot holes in the locations marked "A".

(c) Ascertain that the holes are in alignment and rectify, if and as necessary, by smoothing over lengthwise.

(d) Position angle "6" and spacer "8" and counterdrill blind rivet holes "A" as per Chapter 70-50-50. Deburr.

(e) Pin angle-plate "6" onto the front frame, and counterdrill the "D" holes as indicated in Fig. 405.

OLYMPUS 593

MK.610-14-28

OVERHAUL

- (f) Rivet angle-plate "6" to the front frame as shown in Fig. 405 and directed in Chapter 70-50-40
- (g) Check the riveting as instructed in Chapter 70-50-86.
- H. Applying Reinforcement Angle-plate "7" to the First frame.
- (1) Making up reinforcing angle "7" :
- (a) Tailor the angle-plate from P3344 metal sheet of 1 mm (0.039 in.) thickness as instructed in Fig. 408, Sheet 5.
- (2) Mount reinforcing angle "7" as follows :
- (a) Put the angle-plate in position on the first frame with due regard for the outer contour of the bucket, as indicated in Fig. 405, Sheet 4. Mark the locations of the 2 outer most holes and of one in the middle, marked "D", and take down.
- (b) Drill the pre-marked holes to 4,17 mm (0.164 in.) dia., then put back and pin the angle-plate on the first frame.
- (c) Note the locations of all the other "D" holes, and remove the reinforcement angle-plate.
- (d) Drill out the pilot holes marked "D" to 3,25 mm (0.128 in.) dia.
- (e) Remount the angle-plate, check the alignment of the "D" holes, and rectify, if necessary, by reworking lengthwise. Remove.
- (f) Drill out the "D" holes to their final dia. Deburr.
- (g) Rivet the reinforcement angle-plate onto the first frame as indicated in Fig. 405, and in Chapter 70-50-40
- (h) Check the riveting as per Chapter 70-50-84.

78-31-01

REP 1-460-6

Page 406

MK.610-14-28
OVERHAUL

I. Mounting the Doublers.

- (1) Drill pilot holes in the locations marked "F" and "G" on the panel, proceeding as follows :

- (a) Lightly sandpaper the outer panel skin so as to make the cellular structure apparent.
- (b) Mark out the locations of the "F" and "G" holes as shown in Fig. 405.

NOTE : These holes must each lie in the middle of a cell.

- (c) Drill the pilot holes to 2,5 mm (0.100 in.) dia., and Deburr.

- (2) Cut inner doublers "9" and "10" out of P3344 metal sheet, 1 mm (0.039 in.) in thickness, and shape them up as shown in Figs 405 and 407.

NOTE : The inner doubler sizes vary with the "F" holes marked out and the panel cutout (see Figs. 405 and 407).

- (3) Pre-cut outer doubler "11" out of P3344 metal sheet of 2 mm (0.078 in.) thickness, and tailor it as indicated in Figs. 405 and 406.

- (4) Drill the pilot holes in inner doublers "9" and "10" as follows :

- (a) Put the inner doublers in position as shown in Fig. 405, minding their relative positions to the panel cutout (see Fig. 407).

- (b) Drill-mark the locations of holes "F" and "G" through the panel, then remove.

- (c) Drill out pilot holes "F" and "G" to 2,5 mm (0.10 in.) dia., and deburr.

- (5) Drill the pilot holes in outer doubler "11" as follows

- (a) Note the locations of the existing holes ("A", "B" "F", "J", "K") on the frames and the stressskin panel using STABILENE tracing paper.

78-31-01

REP 1-460-6

Page 407

Aug 31/79

OLYMPUS 593

MK.610-14-28

OVERHAUL

- (b) Put the outer doubler in position on the outer bucket panel, then trace the locations of the front frame holes marked "A" and "J". Remove.

NOTE : During this operation, spacer "8" must be in place.

- (c) Drill pilot holes "A" and "J" to a dia. of 3,25 mm (0.128 in.).
- (d) Put the outer doubler in position and check holes "A" and "J" for correct alignment. If necessary, rectify the holes by reworking lengthwise.
- (e) Put the STABILENE paper on the inner face of outer doubler "11", with holes "A" and "J" used as reference.
Drill marked the locations of holes "B", "F", "K".

- (f) Drill pilot holes in the outer doubler to the following diameters :

"B" and "K" holes : 3,25 mm (0.128 in.)

"F" holes : 2,5 mm (0.10 in.)

- (g) Check the alignment of the previously drilled holes, proceeding as follows :

- 1 Stick a piece of STABILENE tracing paper on bucket frames 1 and 2.
- 2 Put the outer doubler in position on the bucket pinning it to the front frame and over some of the "F" holes.
- 3 The alignment of the "F" holes is checked visually.
- 4 The alignment of "B" and "K" holes is checked by tracing the locations of the holes in doubler "11" on the tracing paper and, with the doubler removed, comparing the markings so made with the locations of the existing frame holes.

NOTE : Rectify where necessary, by reworking the holes lengthwise.

OLYMPUS 593

MK.610-14-28

OVERHAUL

- (6) Drill pilot holes "C", "H" and "I" in outer doubler "11", and in the front and the first frames.
- (a) Mark out the locations of holes "C", "H" and "I" on the doubler, as indicated in Fig. 405, using the existing holes for reference.
 - (b) Drill out holes "C", "H" and "I" to 3,25 mm (0.128 in.) dia. Deburr.
 - (c) Position and pin the outer doubler on the bucket.
 - (d) Counterdrill the front frame and reinforcing angle "7" adjoining the first frame to 3,25 mm (0.128 in.) dia.
 - (e) Take the doubler down, and deburr the previously drilled holes.

NOTE : During this operation, the first frame must also be drilled as shown in Fig. 405, Sheet 6, to allow for the subsequent application of the blind rivets.

- (7) Drill out all the doubler retaining holes to their final diameters, proceeding as follows :
- (a) Position and pin inner doublers "9" and "10" on the bucket ; rebore the holes marked "G" to 4.47 mm (0.176 in.) dia. and do the dimpling in the stressskin panel as instructed in Chapter 70-50-50. Unpin.
 - (b) Position and pin inner doublers "9" and "10" and outer doubler "11" on the bucket.

NOTE : Spacer "8" must be in place in the course of the drilling jobs.

- (c) Rebore doubler retaining holes "A", "B", "C", "F", "H", "I", "J", "K", as shown in Fig. 405 and instructed in Chapter 70-50-50.

OVERHAUL

NOTE : During this operation, the first frame has to be rebored as well, as indicated in Fig. 405, Sheet 6, to allow for the subsequent application of the blind rivets.

- (d) Take-off the inner and outer doublers, and deburr.
- (e) Countersink all the holes of outer doubler "11" as shown in Fig. 405 and instructed in Chapter 70-50-50.
- (8) Machine the contours of outer doubler "11" as indicated in Fig. 406.
- (9) Put inner doublers "9" and "10" in position on the outer panel, and rivet them on by the use of CR 2840 rivets, No. "6", as shown in Fig. 405 and described in Chapter 70-50-50.

NOTE : If necessary, machine the rivet heads flush, as shown in Fig. 405, Sheet 5.

- (10) Stick on the dimpling washers with Loctite 306 (P232A) as indicated in Fig. 405.

NOTE : Dimpling washers may be obtained by reuse of the original PLT 1004 blind bolt heads drilled as shown in Fig. 409.

- (11) Put spacer "8" and outer doubler "11" in position, and clip the inner and outer doublers together on the bucket outer panel and the frames.
- (12) Rivet the inner and outer doublers as shown in Fig. 405 and instructed in Chapter 70-50-50.

NOTE : The rivets intended for locations "A", "H", and "J" are not applied until the cover is mounted (see Para. J).

- (13) Check the mounting of the fasteners as instructed in Chapter 70-50-85.

A. Introduction

This repair scheme offers all particulars on the replacement of a damaged outer-panel segment and of angle sections on the corresponding frames.

- It is applicable where the max-length of the cutout does not exceed 450 mm (71.72 in.) and the width 285 mm (11.22 in.).

78-31-01

REP 1-460-7

Page 401

Apr 30/93

OLYMPUS 593

MK.610-14-28
OVERHAUL

- For replacement of the front-frame cover, consult REP 1-460-4.

B. Procedure

(1) Disassembly of panel

- (a) Make a radiographic test using X-ray equipment complete with a long anode target as instructed in standard practices, chapter 70-20-30, shown in figure 401, and further indicated below :

- 1 At points A and B take shots at 15° to bring the repair area into view.
- 2 At point C take a panoramic view of the bucket in the region of the outer-panel attachment points, in order to identify the shims suitable to be sandwiched between frames and panel (only applies to buckets 3511 to 3574 in which the shims are not riveted to the frames).

- (b) Remove fasteners from the outer panel (these are itemized in REP 1-460-3 "Replacement of fasteners") from the doublers, and from the attachment fitting of the ball-screw gearbox, as instructed in Standard Practices, notably :

- in chapter 70-50-10 for NAS rivets
- in chapter 70-50-50 for cherrylock blind rivets
- in chapter 70-50-60 for blind bolts.

Remove nuts around bucket hub as instructed in REP 1-460-2

After removal of the 3 screws from the attachment fitting of the ball-screw gearbox, remove the 3 nuts by drilling, as described in REP 1-460-13..

- (c) Disassembling the outer panel

NOTE : To keep the shims from falling between panel and frames on disassembly, fasten them to the frames.

Carefully mark the locations of all screws, bushings and washers for identical reassembly.

OVERHAUL

(2) Repair of damaged panel segment

- (a) Cut the damaged segment out of the panel as shown in figure 402 and instructed in standard practices, chapter 70-30-10.
- (b) From a 0,8 mm (0.032 in) thick P 3305 sheet cut a closeout strip of the needed length and of 7,9 mm (0.311 in) width. Shape it to match the contour of the cutout.
- (d) Do a particularly meticulous cleaning with a pad soaked in isopropyl alcohol (P 442), going over the surface involved repeatedly until it is free from the least trace of grease.
- (d) Adjust and tack-weld, by the argon arc procedure, with filler wire P 3008, the closeout strip to the panel cutout, as instructed in standard practices, chapter 70-35-10.
- (e) From a stressskin panel (3711) cut out a piece suited to the repair area in a max. size of approx. 420 mm (16.53 in) X 270 mm (10.63 in).
- (f) Mould the patch to the curved outline of the bucket. Crush the forward edge to match the outline of the adjacent segment, as shown in view D, Figure 402, and instructed in standard practices, chapter 70-30-10.
- (g) Do a class B1 seam welding at the crushed edge, as instructed in standard practices, chapter 70-35-20.
- (h) Shape the patch to suit the contour of the cutout
- (i) Treat the patch as follows :
 - Take into solution in argon at 1065°C for 15 min. Cut off argon supply.
 - Quench in argon at 955°C for 20 min. Cut off argon supply.
 - Refrigerate at - 75°C for 6 hours.
 - Age-harden at 605°C for 1 1/2 hour. Cut off air supply.

OVERHAUL

- (j) As this treatment may have wrested the patch out of shape, remedy any deformation by glass-bead shot peening,, using facilities of the following characteristics :
- Sandblasting unit with a nozzle of 12 mm (0.47 in) dia.
 - Glass beads of 0,5 mm (0.020 in) dia.
 - Sandblasting at a 3-bar pressure by cycles of 30 sec to 1 min.
 - Nozzle-to-panel spacing : 200 to 250 mm (7.87 to 9.84 in).
- (3) Replacement of damaged angle section on front frame
- (a) Cut the damaged segment out of the front-frame angle over a max. length of 400 mm(15.75 in). Grind and drive out the rivets to release the angle iron. Remove a rivet on either side of the cutout limits.
- (b) From a 12 mm (0.047 in) thick P 3305 face sheet, cut the front-frame angle to the max. measurements of approx. 420 mm (16.53 in) by approx. 78 mm (3.07 in). Match the angle iron to the segment contours and adjust in size (see figure 402, view B).
- (c) Put the angle in position on the front frame and argon arc-weld with filler wire Z8 CND 15 (P 3008) as instructed in Standard Practices, chapter 70-35-10.
- (d) Make a soundness test of the class B1 weld as instructed in Standard Practices, chapter 70-35-80, and hereunder :
- A water-washable dye penetrant inspection is carried out by Method M 501 B described in Standard Practices, chapter 70-20-10.
- CAUTION : THE PENETRANT IS TO BE CLEARED OUT WITH A SWAB SOAKED WITH ISOPROPYL ALCOHOL (P442).
- (e) Counterdrill the through holes between angle and frame to a dia. of 4,05 mm \pm 0,1 $\begin{matrix} 0.159 \\ 0.163 \end{matrix}$ in, and deburr.
- (f) Rivet angle to frame with rivets MS 20615-5 M5, as instructed in Standard Practices, chapter 70-50-10.

OVERHAUL

- (g) Check riveting as instructed in Standard Practices, chapter 70-50-81.
 - (h) Machine-flush welds on top part of angle.
- (4) Replacement of damaged angle section on frame 1

Should the first-frame angle iron be damaged, replace it as follows.

- (a) Cut the damaged segment out of the angle section over a max. length of 400 mm (15.76 in) angle. Take out the HI-LOK screws so as to release the angle. Remove a screw on either side of the cut-out limits.
 - (b) From a 1,6 mm (0.063 in) thick P 3305 face sheet, cut out the angle for frame 1 to the max. measurements of approx. 420 mm (16.53 in) by approx. 65 mm (2.56 in), match it to the contour of the segment, and adjust in size (see figure 402, view C).
 - (c) Put the angle in position on the frame and weld in the same way as described under (c) and (d) of section B (3) above.
 - (d) Counterdrill the through holes between frame and angle to a dia. of 4,83 mm \pm 0,1 (0.190 in) ; and deburr.
 - (e) Screw back the HI-LOK retaining screws HL 40-5-3 as instructed in Standard Practices, chapter 70-50-40.
 - (f) Check that the HI-LOK fasteners have been properly fitted in compliance with the instructions in Standard Practices, chapter 70-50-84.
 - (g) Machine-flush the weld beads on the upper part of the angle.
- (5) Welding-on the patch

CAUTION : IT IS ESSENTIAL TO ADHERE TO THE INSTRUCTIONS BELOW IF THE PANEL IS TO BE KEPT FROM GETTING OUT OF SHAPE IN THE WELDING.

78-31-01

REP 1-460-7

Page 405

May 31/77

OLYMPUS 593

MK.610-14-28

OVERHAUL

- (a) Thoroughly clean the patch with a swab soaked in isopropyl alcohol (P 442), going over it repeatedly until the welding area is completely free from any grease.
- (b) On the inner panel skin, seal off the two retaining holes (see figure 402), to be used for argon intake, with adhesive tape.
- (c) Working from the centre outwards to the edges pin back the panel, only leaving out the two inlet holes above and the two retaining holes on frame 2, which serve for argon exhaust (see figure 402).
- (d) Put the patch in position on the assembly, and drill a 3 mm (0.118 in) dia. hole in the outer skin only, for letting the argon through.

NOTE : This hole can be drilled at the height of frame 1 and may subsequently act as a panel retaining hole (see figure 402).

- (e) Blow argon for at least 2 hours through the two holes in frame 1 to purge out the panel and through the 3 mm hole to purge the patch.
- (f) Argon-arc-weld the patch on with filler wire P 3008, as instructed in Standard Practices, chapters 70-30-10 and 70-35-10, and hereunder :

NOTE : It is essential in welding to apply copper cooling blocks as close to the weld as possible.

- Tack-weld the patch on its outer face
- Take down the panel and tack-weld the inner face
- Pin back the panel in the same way as the first time, and weld outer face.

PRINTED IN FRANCE

REP 1-460-7

Page 406

May 31/77

OLYMPUS 593

MK.610-14-28

OVERHAUL

- Take down the panel and weld the inner face.

- (g) Perform a B1 weld soundness test as instructed in Standard Practices, chapter 70-35-80, and hereunder :

A water-washable dye penetrant inspection is carried out by Method M 501 B as instructed in Standard Practices, chapter 70-20-10.

CAUTION : THE PENETRANT IS TO BE CLEARED OUT WITH A SWAB SOAKED IN ISOPROPYL ALCOHOL (P 442).

- (h) Machine-flush the weld on the panel inner face in the region of the frames.

- (6) Drilling the panel and the two angle sections

This is done when the angles of the front frame and frame 1 have been repaired.

- (a) Pin up the panel on the assembly working from the middle outwards to either edge.
- (b) Matchmark on the patch the locations of the holes in each frame with reference to the existing holes and their centre-to-centre distances.
- (c) Counterdrill the panel and angles as instructed in Standard Practices, chapter 70-50-60, and hereunder :

- counterdrill panel and angle to a stem-end pitch circle dia. of $5,05 + 0,08 \text{ mm}$ $\left(\begin{matrix} 0.199 \\ 0.202 \end{matrix} \text{ in} \right)$
- 0

- bore out the top covering sheet of the panel alone to a head-end pitch circle dia. of $6,76 + 0,08 \text{ mm}$ $\left(\begin{matrix} 0.266 \\ 0.269 \end{matrix} \text{ in} \right)$
0

- do the dimpling

- (d) Take down the panel and carefully deburr the angles and panel.

78-31-01

REP 1-460-7

Page 407

May 31/77

OLYMPUS 593

MK.610-14-28
OVERHAUL

- (7) Drilling the panel and angle section of the front frame.

This is done when the front-frame angle alone has been repaired, without the first-frame angle being impaired in any way.

- (a) Stick some tape of polyester tracing-fabric on the first-frame angle section. Matchmark the locations of retaining holes within and outside the panel repair area.
- (b) Transfer the tracing-cloth tape to the panel inner face at the height of frame 1, making it register with the existing retaining holes. Matchmark the locations of the new retaining holes on the patch.
- (c) Drill the retaining holes thus marked as instructed in Standard Practices, chapter 70-50-60, and hereunder :
 - Drill to a stem-end pitch circle dia. of
$$5,05 + 0,08 \text{ mm } (0.199 \text{ in})$$
$$- 0 \text{ mm } (0.202 \text{ in})$$
 - Bore out the panel outer covering sheet alone to a head-end pitch circle dia. of
$$6,76 + 0,08 \text{ mm } (0.266 \text{ in})$$
$$- 0 \text{ mm } (0.269 \text{ in})$$
 - Do the dimpling
 - Deburr the panel.
- (d) Pin up the panel on the assembly, working from the middle outward to either edge.
- (e) Counterdrill panel and angle of front frame in the same way as in Section (6) above.

- (8) Reassembly of panel

For buckets 3511 to 3574, insert any shims identified by X-ray examination. Make them adhere to the frames by applying a coat of pure petrolatum.

A. Introduction

This repair scheme offers all particulars on the repair of cracks, in the region of the plug welding on the heat shield attachment inserts.

The scheme is limited to 3 successive inserts and a maximum of repairs on each bucket.

B. Excision of the damaged segment

- (1) X-ray-check the bucket to mark off any cracks on the insert plug-welding as instructed in Standard Practices, Chapter 70-20-30.
- (2) Remove the trailing-edge fastenings within the limits shown in figure 403, sheet 1 of 6, following the instructions in Standard Practices, chapter 70-50-10. For disassembly of back-up plates, see REP 1-460-5.

78-31-01

REP 1-460-9

Page 401

Apr 30/93

OLYMPUS 593

MK.610-14-28
OVERHAUL

- (3) Cut out the cracked panel segment within the boundaries laid down in figure 403, sheet 1 of 6, as instructed in Standard Practices, chapter 70-30-10.
- (4) Remove the fastenings marked (A) (see figure 402, sheet 1 of 6) as instructed in Standard Practices, chapter 70-50-40.

C. Repair of cut-out segment

- (1) Contain cracking by a 3 mm (0.118 in) hole at either end.

D. Making doublers

- (1) From a 1 mm (0.039 in) thick P 3305 face sheet, cut out two segments larger in size than the doublers. Shape these segments to match the contour of the area under repair.
- (2) Mark and drill out on the doublers the location(s) of the insert(s) according to the requirements of the particular repair job.
- (3) Treat the doublers with air
 - of 760°C for 1.30 hrs
 - of 565°C for 1.30 hrs
- (4) After treatment, put them back into shape as necessary
- (5) Put the doubler in position on the bucket and adjust in size as shown in figure 403, sheet 1 of 6.

E. Drilling panel segment and doublers

Depending on the site of repair, there are two alternative forms of assembly, viz :

- one for the trailing edge area with attachment points marked (2) ; see figure 402, sheet 1 of 2
- Another for general use, with all other attachment points

PRINTED IN FRANCE

OLYMPUS 593

MK.610-14-28

OVERHAUL

(1) General use

- (a) Anchor the inner and outer doublers around the bossing by arc-welding, with filler wire P 3030, as instructed in Standard Practices, chapter 70-35-10.
- (b) Check the B1 class weld for soundness as directed in Standard Practices, Chapter 70-35-80.
- (c) Drill holes marked (B) to a dia. of $3.25 \begin{smallmatrix} + 0.1 \\ - 0 \end{smallmatrix}$
0.128
0.132 in
- Hole spacing on cutout edge : max. 1 pitch
 - Spacing between 2 holes : 2 or 3 pitches
- (d) Dimple the outer doubler and the panel at $156^\circ + 1^\circ$ to a dia. of $12 \begin{smallmatrix} + 0.460 \\ - 0.3 \text{ mm} \end{smallmatrix}$ 0.484 in
- (e) Insert rivets and washers in the holes marked (B) Carry out arc-plug-welding on the washer side with filler wire P 3030, as instructed in Standard Practices, chapter 70-35-10.
- (f) Check B1 class plug-weld for soundness as instructed in Standard Practices, chapter 70-35-80
- A water washable dye penetrant inspection is carried out by Method M 501 B, chapter 70-20-10.
- (g) Stick a strip of tracing-cloth on the bucket and mark the locations of holes(A)
- (h) Put the doublers-and-panel assembly in position on the bucket, stick the tracing-cloth tape on the outer doubler, and disassemble.
- NOTE : For correct placing of the panel, align the trailing edges and centre the cutouts.
- (i) Mark and drill holes(A) to a dia. of $4.8 \begin{smallmatrix} + 0.1 \\ - 0 \end{smallmatrix}$ mm
0.189
0.192 in and deburr.

OLYMPUS 300

MK.610-14-28
OVERHAUL

- (j) Put the assembly in position on the bucket, and pin on.
- (k) Centre and drill the holes marked (C) to a dia. of
 $4.8 \begin{smallmatrix} + 0.1 \\ 0 \end{smallmatrix} \begin{smallmatrix} 0.189 \\ 0.192 \end{smallmatrix}$ in
- (l) Centre and drill the holes marked (D) to a dia.
of $4.05 \begin{smallmatrix} + 0.1 \\ 0 \end{smallmatrix}$ mm $\begin{smallmatrix} 0.159 \\ 0.163 \end{smallmatrix}$ in
- (m) Take down the doublers-and-patch panel assembly, and carefully deburr all holes previously drilled.
- (n) Put back the assembly, and dimple the holes marked (A) and (C) at $100^\circ \pm 1^\circ$ to a dia. of
 $10.4 \begin{smallmatrix} + 0.2 \\ - \end{smallmatrix}$ mm $\begin{smallmatrix} 0.401 \\ 0.417 \end{smallmatrix}$ in
- (o) Bore out holes (A) and (C) to a dia. of $5.21 \begin{smallmatrix} + 0.1 \\ 0 \end{smallmatrix}$ mm
 $\begin{smallmatrix} 0.205 \\ 0.209 \end{smallmatrix}$ in ; Deburr.
- (p) Counterdrill trailing-edge holes on outer doubler to a dia. of $4.05 \begin{smallmatrix} + 0.1 \\ 0 \end{smallmatrix}$ mm $\begin{smallmatrix} 0.159 \\ 0.163 \end{smallmatrix}$ in
- (2) Assembly for trailing-edge area with attachment points marked (2) ; see figure 402, sheet 1 of 2.
- (a) Put patch and outer doubler in position on bucket.
- (b) Counterdrill trailing-edge holes on outer doubler to a dia. of
 $4 \begin{smallmatrix} + 0.1 \\ - \end{smallmatrix}$ mm $\begin{smallmatrix} 0.153 \\ 0.161 \end{smallmatrix}$ in ; Deburr.
- (c) Remove the assembly and take inserts out of the bucket inner panel.
- (d) Dimple the doubler at $160^\circ \pm 1^\circ$ to a dia. of
 $17.5 \begin{smallmatrix} + 0.2 \\ - \end{smallmatrix}$ mm $\begin{smallmatrix} 0.681 \\ 0.696 \end{smallmatrix}$ in
- (e) Bore out the doubler to a dia. of $7.924 \begin{smallmatrix} + 0.025 \\ 0 \end{smallmatrix}$ mm
 $\begin{smallmatrix} 0.312 \\ 0.313 \end{smallmatrix}$ in ; Deburr.

OLYMPUS 593

MK.610-14-28
OVERHAUL

(f) Fit inserts 649-773-239-0 in the doubler holes

Next repeat operations described in Section
"General Use" (a) to (n) above.

E. Assembly of doublers and patch panel.

- (1) Put doublers-and-patch assembly in position on bucket.

NOTE : For correct positioning, align the trailing
edges and centre the cutouts.

- (2) Rivet the assembly on the bucket as instructed in
Standard Practices, chapters :

- 70-50-50 for rivets marked (A) and (C) (see figure)
- 70-50-10 for trailing-edge rivets.

For trailing-edge fasteners, consult table in figure
402, sheet 2 of 2, and REP 1-460-5 in case of back-
up plate reassembly.

- (3) Put rivets (D) in place together with washers, machine-
flush the rivets and arc plug-weld to outer doubler
with filler wire P 3030, as instructed in Standard
Practices, chapter 70-35-10.

- (4) Check riveting as instructed in Standard Practices,
chapters :

- 70-50-81 for trailing-edge rivets
- 70-50-85 for rivets (A) and (C)

- (5) Check plug weld for soundness as instructed in Stan-
dard Practices, chapter 70-35-80 type B1.

- A water washable dye penetrant inspection is carried
out by Method M501 B in Standard Practices, chapter
70-20-10.

REPAIR

REVERSER BUCKET (1-460)

11. Repair of cracks on the inner and outer panels

PARTS REQUIRED FOR REPAIR

Weld filler wire P3008 or P3030

A. Repair of cracks developed away from edges.

(1) Repair limitations.

- A sound area of 100 mm (3.9 in) around the zone to be repaired is required.
- The crack must not be located within a delaminated zone.

(2) Repair instructions

- (a) Check the crack surrounding zone for suitable condition.

Inspection by aural checking (tap-test) using a coin to make sure that the zone concerned is not delaminated.

Otherwise, this type of repair could not be applied.

- (b) Accurately delimit the crack using a binocular magnifier (X 20 magnification) and drill out a 1 mm (0.039 in)-dia hole at each end of the crack.

CAUTION: ONLY THE UPPER SHEET METAL SHOULD BE DRILLED.

- (c) Argon-arc-weld the crack as instructed in chapter "PRINCIPLES FOR REPAIRING COMPONENTS MANUFACTURED BY A WELDED HONEYCOMB TYPE STRUCTURE", 70-30-10 and chapter "WELDING" 70-35-10.

78-31-01

snecma

Weld filler wire: P3008 or P3030
Class of weld: P1.

NOTE: It is essential in welding to apply copper cooling-blocks as close to the welding zone as possible.

- (d) Inspect the class B1 welding as instructed in chapter "WELDING" 70-35-80 and hereunder:

A water-washable dye penetrant inspection is carried out by method M501B in chapter 70-20-10.

CAUTION: THE DYE PENETRANT SHALL BE REMOVED WITH A SWAB SOAKED IN ISOPROPYL ALCOHOL (P442).

- (e) Inspection check the repaired zone for delamination (tap-test using a coin).

B. Repair of cracks developing in original weld beads

(1) Repair limitations

- The crack must not be located within a delaminated zone.
- No length limits.

(2) Repair instructions

Repair instructions for cracks of this type are the same in paragraph A.

C. Repair of cracks developing from a rivet hole (see figure 403)

(1) Repair limitations

- A sound zone of 100 mm (3.9 in) around the repair area is required.
- The crack must not be located in a delaminated zone.
- The crack length must not exceed 25 mm (1 in).

A. Introduction

This repair scheme offers all particulars on the replacement of a damaged outer panel segment lying in an area shown in figure 401.

- The stressskin patch may come
 - from a P 3711 stressskin panel
 - from a new outer skin panel
 - from a sound segment of a discarded skin panel.

78-31-01

REP 1-460-12

Page 401

May 31/77

OLYMPUS 593

MK.610-14-28
OVERHAUL

B. Disassembly of outer panel

(1) Checking on the extent of damage

- (a) Make a radiographic test using X-ray equipment complete with a long anode target as instructed in Standard Practices, chapter 70-20-30, shown in figure 401, and further set out below :
- at points A and B, take shots at 15° to bring the repair area into view
 - at point C take a panoramic view of the bucket in the region of the outer-panel attachment points, in order to identify the shims suitable to be sandwiched between frames and panel (only applies to buckets 3511 to 3574 in which the shims are not riveted to the frames).

(2) To take-off the outer panel, proceed as follows :

- (a) Remove the outer-panel fasteners as instructed in repair schemes

- REP 1-460-3 "Replacement of inner and outer panel fasteners"
- REP 1-460-5 "Replacement of back-up plates"

Remove nuts around the bucket hub, as described in REP 1-460-2.

After removal of the 3 screws, take the 3 blind nuts out of the ball-screw gearbox attachment fitting, as described in REP 1-460-13.

- (b) Disassembling the outer panel

NOTE : To keep the shims from falling between panel and frames on disassembly, fasten them to the frame.

Carefully mark the locations of all screws, bushings and washers for identical reassembly.

C. Repair of damaged panel segment

- (a) Cut the damaged segment out of the panel as shown in figure 402, and instructed in Standard Practices, chapter 70-30-10 : Principles of repairing welded honeycomb structures.

PRINTED IN FRANCE

MK.610-14-28

OVERHAUL

- (2) From an 0,8 mm (0.032 in) P 3305 sheet, cut a close-out strip of the needed length and of 7,9 mm (0.311 in) width. Shape it to match the contour of the cutout.
- (3) Heat-treat the strip by Methods M 821 and M 822 described in chapter 70-45-10 : "HEAT TREATMENTS".
- (4) Do a particularly meticulous cleaning with a pad soaked in isopropyl alcohol (P 442), going over the surface involved repeatedly until it is perfectly free from any grease.
- (5) Adjust and tack-weld by the argon arc procedure, with filler wire P 3008, the closeout strip to the panel cutout, as instructed in Standard Practices, chapter 70-35-10 : Fusion Welding.

D. Making patches

Depending on their source, patches can be made in one of two ways.

(1) Patches from a ready-formed skin

- (a) Cut a stressskin-panel segment appropriate to the repair area out of a rejected or a new outer skin, as instructed in Standard Practices, chapter 70-30-10 "REPAIR PRINCIPLES" and indicated in figure 402.

NOTE : Use a patch size increased by 1 mm (0.040 in)

- (b) Adjust the patch to the contours of the cutout.

(2) Patches from a stressskin panel

- (a) Cut a stressskin panel segment suited to the repair area from a stressskin panel (3711)

- The size is to be increased by 10 mm (0.400 in)

MK.610-14-28

OVERHAUL

- (b) Mould the patch to the curved outline of the bucket. Crush the forward edge to match the contour of the adjacent segment, as shown in figure 402, and instructed in Standard Practices, chapter 70-30-10 : "Principle of Repairing Welded Honeycomb Structures"
- (c) Do a class B1 seam welding at the crushed edge, as instructed in Standard Practices, chapter "WELDING", 70-35-20 (Resistance Welding) and in 70-30-10.
- (d) Shape the patch to suit the contour of the cut-out
- (e) Treat the patch as follows :
- Take into solution in argon at 1065°C for 15 min.
Cut off argon supply
 - Quench in argon at 955°C for 20 min.
Cut off argon supply
 - Refrigerate at 75°C for 6 hrs
 - Age-harden at 605°C for 1 1/2 hrs
Cut off air supply.
- (f) As this treatment may have wrested the patch out of shape, remedy any deformation by glass-bead shot peening, using facilities of the following characteristics :
- Sandblasting unit with a nozzle of 12 mm (0.47 in)
 - Glass beads of 0,5 mm (0.02 in) dia.
 - Sandblasting at a 3-bar pressure by cycles of 30 sec. to 1 min.
 - Nozzle-to-panel spacing 200 to 250 mm (7.87 to 9.84 in).

E. Mounting the patch

(1) Welding on the patch

CAUTION : IT IS ESSENTIAL TO ADHERE TO THE INSTRUCTIONS BELOW IF THE PANEL IS TO BE KEPT FROM GETTING OUT OF SHAPE IN THE WELDING.

- (a) Thoroughly clean the patch with a swab soaked in isopropyl alcohol (P 442), going over it repeatedly until the welding area is completely free from any grease.

PRINTED IN FRANCE

OVERHAUL

- (b) On the inner panel skin, seal off the two retaining holes, to be used for argon intake, with adhesive tape (see figure 402).
- (c) Working from the centre outwards to the edges, pin back the panel, only leaving out the two inlet holes above, and two retaining holes on the frame, which serve for argon exhaust (see figure 402)
- (d) Put the patch in position on the assembly, and drill a 3 mm (0.118 in) dia. hole in the outer skin only, for letting the argon through.

NOTE : This hole can be drilled at a spot where it may subsequently act as a panel retaining hole (see figure 402).

- (e) Blow argon for at least 2 hrs through the 2 holes in the frame to purge out the panel, and through the 3 mm hole to purge the patch.
- (f) Argon-arc-weld the patch on with filler wire P 3008 as instructed in Standard Practices, chapters 70-30-10 and 70-35-10, and hereunder :

NOTE : It is essential in welding to apply copper cooling-blocks as close to the weld as possible.

- Tack-weld the patch on its outer face
 - Take down the panel and tack-weld the inner face
 - Pin back the panel in the same way as the first time and weld outer face
 - Take down the panel and weld the inner face
- (g) Perform a B1 weld soundness test as instructed in Standard Practices, chapter 70-35-80, and hereunder :

A water-washable dye penetrant inspection is carried out by Method M 501 B described in chapter 70-20-10.

OLYMPUS 593

MK.610-14-28
OVERHAUL

CAUTION : THE PENETRANT IS TO BE CLEARED OUT
WITH A SWAB SOAKED IN ISOPROPYL
ALCOHOL (P 442).

(h) Machine-flush the weld on the panel inner face,
in the area in contact with the inner panel.

(2) Drilling the panel

To be done if the patch derives from a P 3711 stress-
kin panel or a new outer skin.

There are two cases to consider, viz :

(a) The patch is located downstream of frame 3 :

- Pin the panel onto the assembly
- Counterdrill the patch along the trailing edge, with the inner panel acting as drilling template

NOTE : Consult REP 1-460-3 to identify the attach-
ments and determine the resulting conditions
of drilling

(b) The patch laps into frame 3 :

- Stick a piece of stabylene tape on the angle of frame 3. Mark the locations of retaining holes within and outside the panel repair area.
- Stick the stabylene tape on the panel inner face in the region of frame 3, making it register with the existing holes. Matchmark the hole locations on the patch.
- Drill out the holes so marked, as instructed in Standard Practices, chapter "Riveting", 70-50-60. Assemble with blind bolts as described in repair scheme REP 1-460-3
- Pin the panel into position on the assembly working from the middle outwards to the edges.
- Counterdrill the patch along the trailing edge, with the inner panel serving as drilling template.

PRINTED IN FRANCE

78-31-01

REP 1-460-12

Page 406

May 31/77

NOTE : Consult REP 1-460-3 to identify attachments and determine the resulting conditions of drilling.

F. Plasma spraying of patch

Spray chromium carbide onto the trailing edge of the patch as indicated in figure 402, sheets 1 and 2 and in chapter 70-65-20.

- Spraying material : P 3202 (chromium carbide)
- Surface condition : 3.2/ (0.126/)
- Spray area tolerance : + 12,5 (+ 0.490)
+ 0 (+ 0.000)

G. Reassembly of outer panel

For buckets 3511 to 3574, insert any shims identified by the X-ray test. Hold them onto the frames by applying a coat of pure petrolatum.

- (1) Rivet the panel to the frames in reverse order of disassembly, working from the middle outwards to the edges, as instructed in repair scheme
 - REP 1-460-3 "Replacement of inner and outer panel fasteners"
 - (2) Fit back all screws, nuts and washers into their original (pre-disassembly) places, working from the middle outwards to the edges, as instructed in repair schemes
 - REP 1-460-2 "Replacement of fasteners next to bucket hub"
 - 1-460-13 "Replacement of blind nuts securing ball-screw gear-box attachment fitting".
 - (3) Remount back-up plates as described in REP 1-460-5.
- H. Mark "REP 12" after bucket No. by Method M 21 contained in chapter 70-10-10 "MARKING".

REPAIR

REVERSER BUCKET (1-460)

13. Replacement of Crimped Nuts Securing Ball-screw Gearbox
Attachment Fitting

PARTS REQUIRED FOR REPAIR

Blind nut BTN 1LG-428-12 (649-783-047-0)
Special washer (525-003-859-0)

A. Removal of crimped nut

- (1) Remove fitting retaining screw and slip out shims
- (2) Bore the fitting as indicated in figure 401
- (3) Drill to a dia. of 7,6 mm (0.3 in) to take out the crimped nut.

NOTE : Remove chips dropped into the recess as far as practicable.

B. Remounting the crimped nut

- (1) Fit back the crimped nut by the use of manufacturer's assembling device as indicated in figure 401 and following manufacturer's instructions.

NOTE : Mind the position of the anti-rotation pin

- (2) Check that the nut is properly crimped and its thread has not been damaged in assembly.
- (3) Reinsert the shims between fitting and panel, mount back the special washer, and refit the screw.

A. Disassembly of outer panel**(1). Checking on the extent of damage**

- (a) Make a radiographic test using X-ray equipment with a long anode as instructed in Standard Practices, chapter 70-20-30, shown in figure 401 and further set-out below :

- At points A and B, take shots at 15° to bring the repair area into view.

PRINTED IN FRANCE

- At point C take a panoramic view of the bucket in the region of the outer panel attachment points in order to identify the shims suitable to be sandwiched between frames and panel (only applies to buckets 3511 to 3574 in which the shims are not riveted to the frames).

(2) Remove the outer panel as follows :

(a) Remove the outer panel fasteners as instructed in repair schemes

- REP 1-460-3 "Replacement of inner and outer fasteners"
- REP 1-460-5 "Replacement of back-up plates"

Remove nuts around the bucket hub as described in REP 1-460-13.

After removal of the three screws, take the three blind nuts out of the ball-screw gearbox attachment fitting as described in REP 1-460-13.

(b) Disassemble the outer panel

NOTE : To keep the shims from falling between panel and frames on disassembly, fasten them to the frame.

Carefully mark the location of all screws, bushings and washers for identical reassembly.

B. Preparation of damaged panel segment

- (1) At each end, and in the vicinity of the crack, drill 2 mm (0,08 in.)-dia holes as shown in figure 402.
- (2) Groove through the panel along the whole crack length as prescribed in chapter "REPAIR PRINCIPLE", 70-30-10.
 - Groove width : 1 mm (0.04 in.) max.
- (3) Deburr carefully.
- (4) Thoroughly clean the machined area with a swab soaked in isopropyl alcohol (P442) going over it repeatedly until the welding area is completely free from any grease.

78-31-01

REP 1-460-14

OLYMPUS 593

MK.610-14-28

OVERHAUL

- (5) Seal off the outer panel attachment holes using adhesive tape, except those shown in figure 402.

C. Repair of the outer panel

- (1) Cut out the foil strip to be welded as follows :

- (a) Cut out a 0,8 mm (0.32 in.)-thick strip from P3305 sheet metal to required length and "X" width.
(see figure 402).
- (b) Drill a hole through the strip for argon passage as per figure 402.
- (c) Heat treat the strip as instructed in method M821 and M822, chapter 70-45-10 "HEAT TREATMENTS".

- (2) Repair the outer panel as follows :

- (a) Purge the outer panel by introducing argon through the argon throughlet hole for 30 minutes at least.
- (b) Position and tack-weld the strip in the groove.
- (c) Arc-weld the strip in the groove and in argon atmosphere as instructed in chapters "REPAIR PRINCIPLE" 70-30-10, "WELDING" 70-35-10 and as per figure 402.

- Weld filler wire : P3008
- Class of weld : P1

NOTE : It is essential in welding to apply copper-cooling-blocks as close to the weld as possible.

- (d) Seal off the argon inlet and outlet holes by welding.

OLYMPUS 593

MK.610-14-28

OVERHAUL

- (e) Perform a B1 weld soundness test as instructed in Standard Practices, chapter 70-35-80, and hereunder :

A water-washable dye penetrant inspection is carried out by method M501B described in chapter 70-20-10.

CAUTION : THE PENETRANT IS TO BE CLEARED OUT WITH A SWAB SOAKED IN ISOPROPYL ALCOHOL. (P442).

- (f) If necessary, machine-flush the weld on the outer panel inner face in the area in contact with the inner panel.

D. Reassembly of outer panel

For buckets 3511 to 3574 insert any shims identified by the X-ray test. Hold them onto the frames by applying a coat of pure petrolatum.

- (1) Rivet the panel to the frames in reverse order of disassembly, working from the middle outwards to the edges, as instructed in repair scheme :

- REP 1-460-3 "Replacement of inner and outer panel fasteners"

- (2) Fit back all bolts, nuts and washers into their original (pre-disassembly) places as instructed in repair schemes :

- 1-460-2 "Replacement of fasteners next to bucket hub"

- 1-460-13 "Replacement of blind nuts securing ball-screw gear-box attachment fitting".

- (3) Remount back-up plates as described in REP 1-460-5.

- E. Mark "REP 14" after bucket No. by method M21 in chapter 70-10-10 "MARKING".

A. Introduction

This repair scheme requires the removal of the rear outer doubler in order to repair the crack (1) originating from the deflector attachment point.

B. Removal

Remove the rear outer doubler as follows :

- (1) Remove the shims and seal support after removing the fasteners as indicated in repair scheme 1-460-5 of this chapter.

NOTE : Matchmark the shims for correct re-installation.

- (2) Remove the rear doubler fasteners by drilling as instructed in chapter 70-50-50 and figure 401.

78-31-01

REP 1-460-15

Page 401

Apr 30/93

OLYMPUS 593

MK.610-14-28

OVERHAUL

NOTE : Exercise care not to damage the stepped washers.
Mark their position. Remove and retain them.

- (3) Remove the rear doubler. Install fasteners at seal support attachment points so as to retain the shims sandwiched between the panels (see figure 401 in REP 1-460-5).

NOTE : Be careful not to loose the bushes.

C. Repair of crack

- (1) Remove the original press-mounted nut by drilling as follows :
 - (a) Remove thread insert No. 3591-4CNV-0250 using manufacturer's extractor as per REP 1-460-2 in this chapter.
 - (b) Remove the nut by successive runs as per Standard Practices, chapter 70-55-00.

NOTE : Nut recess diameter : 10,35 mm (0.4075 in.) maximum.

- (c) Retain spacer SPC 9405T-0075-0075 to be modified later on.
- (2) Repair the crack, originated from the nut recess hole, by welding as specified in this chapter, repair scheme 1-460-11.

NOTE This repair scheme does not require any sealing of the nut recess contour with elastomer resin.

D. Machining

- (1) Bore the repair nut recess as specified in Standard Practices, chapter "REPAIR PRINCIPLES", 70-30-10, and as per figure 402. Deburr.

78-31-01

REP 1-460-15

Page 402

Jan 31/81

OLYMPUS 593

MK.610-14-28

OVERHAUL

NOTE : Make sure that the hole is perpendicular to the face in contact with the side-plate.

- (2) Spotface the shim, as per figure 402, using a facing cutter with 12 mm (0.4725 in.) dia pilot bit. Deburr.
- (3) Bore through the spacer for nut passage as per figure 402. Deburr.
- (4) Dimensionally inspect the nut recess hole in the bucket and spacer, as per figure 402.

E. Nut installation

Install side-plate fastener as instructed in figure 403 and hereunder :

- (1) Position reworked spacer
- (2) Install the flanged nut with liquid nitrogen (P441). Secure it by argon-arc plug welding as specified in Standard Practices, chapter 70-35-10. Machine flush.
 - (a) Weld filler wire : P3005 (Z5 CNU 17)
 - (b) Class of weld : B1
- (3) Position and assemble the washer and the nut by peripheral argon-arc welding as specified in Standard Practices, chapter 70-35-10.

NOTE : Thoroughly press the washer against the bucket outer panel before welding.

- (a) Weld filler wire : P3005 (Z5 CNU 17)
- (b) Class of the peripheral weld : B1

OLYMPUS 593

MK.610-14-28
OVERHAUL

- (4) Inspect the class B1 plug and peripheral welds as per chapter 70-35-80.
- (5) Install thread insert in nut as instructed in figure 403 and hereunder :
 - (a) Install the thread insert in the recess using standard tool.
 - (b) Inspection check the thread insert installation.
 - (c) Break the drive tongue using the appropriate standard tool.

F. Installation of doubler

- (1) Position and clamp the doubler and washers. Remove the clamps and install the bushes.
 - (a) Position and straighten the doubler through 6,35 mm (0.250 in.)-dia holes. When necessary, draw file the recess accommodating the welded washer.
 - (b) Insert the bushes in the trailing edge (see REP 1-460-5, figure 401). Clamp.
 - (c) Install stepped washers as per figure 401. Clamp.
- (2) Install blind rivets as instructed in Standard Practices, chapter 70-50-50 and figure 401.
- (3) Install shims and seal supports onto the trailing edge as per repair scheme 1-460-5 and chapter 70-50-10.

NOTE : Do not forget the plain washers.

NOTE : Mind the way the shims are positioned.

OLYMPUS 593

MK.610-14-28
OVERHAUL

G. Inspection

- (1) Inspect the doubler fixing items for correct installation as instructed in Standard Practices, chapter 70-50-80.
- (2) Check the doubler 6,35 mm (0.250 in.)-dia holes for free passage of screws. When necessary, draw file as per figure 401.

H. Marking

- (1) Following the part number, mark "REP 15" as per method M21 in chapter 70-10-20.

A. Removal of doublers

- (1) Remove the riveted parts at the trailing edge as indicated in figure 401 and in repair scheme 1-460-5 of this Overhaul Manual.

NOTE 1 : Retain the adjusted shims No. 649-786-484-0.
(See Figure 401, Sheet 2).

NOTE 2 : Matchmark the position of the shims and seal supports for correct re-installation.

- (2) Remove attaching parts as indicated in chapters 70-50-20 and 70-50-50 and in figure 401, and then remove the lateral doublers.

78-31-01REP 1-460-16

Apr 30/93

OLYMPUS 593

MK.610-14-28

OVERHAUL

B. Inspection

- (1) Inspect the fasteners of the inner shims as instructed in chapter 70-50-86 and in figure 401.
- (2) If necessary, replace as indicated in chapter 70-50-60. Inspect after installation as per chapter 70-50-86.

C. Drilling of new doublers

CAUTION : - DO NOT USE HALOGEN PRODUCTS ON TITANIUM ALLOY PARTS.

- USE SPECIAL BUFFING TOOL FOR DEBURRING.

- (1) Undercut the rear doubler for the nut heads as per figure 401 and as follows :
 - (a) Stick a strip of Stabilene paper in line with nuts, and mark the position of the undercuts.
 - (b) Position the rear doubler and then stick strip on doubler. Remove.
 - (c) Centre-punch according to marking, then drill pilot holes for punching.
 - (d) Punch out the nut head recesses to 22 mm (0.866 in.) diameter, and deburr.
- (2) Perform drilling of recesses for stepped washers types E, F, G and H, as indicated in figure 401 and as follows :
 - (a) Stick strips of Stabilene paper on the reverser bucket in line with fasteners type E, F and H, and mark positions.
 - (b) Position the mid doubler using a locator centered in the bucket hub so as to obtain the radius R1. Stick the strips on the doubler, then remove the doubler.

NOTE : When positioning the doubler, take position of front and rear doublers into account.

78-31-01

REP 1-460-16

Page 402

Oct 31/81

OLYMPUS 593

MK.610-14-28

OVERHAUL

(c) Drill pilot-holes of 2,5 mm (0.100 in.) diameter and deburr.

(d) Position the mid doubler and maintain in place using spring clamps and clips.

NOTE : Make sure the radius R1 is respected by means of the locator.

(e) Stick strips of Stabilene paper on the mid doubler in line with fasteners E and F, and centre-punch.

(f) Position the front and rear doublers and maintain in place with spring clamp.

NOTE : Fasten the front doubler with clips in the type J fastener pilot holes.

(g) Stick the strips of Stabilene paper on the doublers and trace the type G fastener holes. Remove the doublers.

(h) Centre-punch according to tracing, and then drill pilot holes for punching.

(i) Punch out stepped washer recesses as indicated in figure 401, and deburr.

(j) Chamfer the washer recesses in the front and rear doublers as per figure 401. Deburr.

(3) Prepare recesses of stepped bushes, fasteners type B, C and D, and drill attachment holes type I and J as indicated in figure 401 and as follows :

(a) Position the front and rear doublers and install the stepped washers. Pin in place.

NOTE : Use spring clamps on the doubler edges to hold elements being assembled firmly together

(b) Centre-punch the position of fasteners B, C, D and I.

(c) Check the alignment of the pilot holes of the front doubler J fasteners.

OLYMPUS 593

MK.610-14-28
OVERHAUL

- 1 If necessary, rework the holes by draw filing.
- (d) Remove the doublers, and then drill pilot holes of 2,5 mm (0.100 in.) diameter. Deburr.
- (e) Rebore the holes as indicated in figure 401, and deburr.

D. Adjustment of doublers

- (1) Shape the lateral doublers to the reverser bucket outer panel contour as follows :
 - (a) Position the doublers, adjust and pin.
 - (b) Use feeler gauge set to check the clearance between the doubler and panel.

NOTE : The maximum clearance is 0,8mm (0.315 in.).

- (c) Shape the doubler according to clearance.
- (2) Position and pin the front doubler, and then check the clearance between the edge and the washer of the actuator attachment fitting, as indicated in figure 402.
 - (a) If required, rework by draw filing.
- (3) Position and pin the front and rear doublers. Check the clearance between the doublers and panel as per figure 402. If necessary, shape.

NOTE : After tightening, play is 0.15 mm (0.006 in.).

- (4) If necessary, rework the end of the rear doubler, as indicated in figure 402, when the distance between the shim "1" fastener and the doubler corner is too large. Deburr.
- (5) Check the edges of the doublers with reference to the reverser bucket outer panel edge. If necessary, trace and then rework by draw filing.

E. Assembly

- (1) Position the doublers and install the washers, bushes and shims as per figure 401.

OLYMPUS 593

MK.610-14-28
OVERHAUL

- (2) Check the adjustment at the trailing edge between the taper shim (item 1) and the outer panel.
- (a) If necessary, rework the compensating shim, P/N 649-786-484-0, to obtain a setting of 0,25 mm (0.100 in.) minimum. Radius the edges in contact with the panel.
- (3) Install the attachment parts as indicated in figure 401 and as follows :
- (a) Install the fasteners type B, C, D and J as indicated in chapter 70-50-20 and repair scheme 1-460-5.
- (b) Install the fasteners type E, F, G and H as indicated in chapter 70-50-50.
- NOTE : Flat washers are required for fasteners F, G and H.
- (4) Inspect the installed fasteners as indicated in chapters 70-50-82 and 70-50-85.

MK.610-14-28

OVERHAUL

A. Introduction.

This procedure provides all the informations necessary for the repair of the inner panel cracked at the attachment point location of the thermal shield.

This repair requires the removal of the inner panel in order to repair it by the installation of doublers.

B. Removal of the inner panel.

- (1) Remove the attachment parts at the bosses level as instructed in REP 1-460-2 and 1-460-3.
- (2) Remove the attachment parts at the leading edge level as instructed in REP 1-460-3 and 1-460-5.
- (3) Remove the attachment parts at the frames level as instructed in REP 1-460-3.

C. Preparation of the doublers.

- (1) From sheet metal P3305, thickness 1 mm (0.04 in.), cut and deburr the following doublers:
 - (a) The outer doubler to dimensions 400 x 600 mm (15.8 x 24.0 in.).
 - (b) The front and rear inner doublers to dimensions 170 x 600 mm (6.7 x 24.0 in.).
- (2) Shape the doublers according to the outlines of the inner panel.
- (3) Mark the location of the thermal shield attachment points on the doublers and machine the openings at 41 mm diameter (1.61 in. Dia).
- (4) Heat-treat the doublers according to procedures M822 and M821 of chapter 70-45-10 of standard practices.
- (5) Clean the doublers according to procedure M100B of chapter 70-15-20 of standard practices.

78-31-01

REP 1-460-17

Page 402

Apr 30/93

OLYMPUS 593

MK.610-14-28

OVERHAUL

- (6) If necessary, rework the holes until correct alignment is obtained, and finish to shape the doublers.

D. Drilling in the panel and in the doublers.

- (1) Lightly rub the surface to be repaired with a very fine emery cloth until the cellular structure is visible.
Blow the dust with compressed air.
- (2) Centre mark the position of the attachment holes in the centre of the cells in the stressskin panel according to figure 401.
- (3) Drill pilot holes of 4,8 mm diameter (0.19 in. Dia) in the centre marked areas. Deburr.
- (4) Position the doublers on the inner panel, then centre mark all the attachment holes. Remove the doublers.
- (5) Drill pilot holes of 4,8 mm diameter (0.19 in. Dia) in the centre marked areas. Deburr.
- (6) Make sure that the holes of the doublers align with the holes of the inner panel. If necessary, rework the holes until alignment is correct.
- (7) Position and fasten the doublers on the inner panel.
- (8) Machine dimples for the recesses of the CR2838 rivet heads at $100^{\circ} \pm 1^{\circ}$ and of 10,2 to 10,6 mm diameter (0.40-0.42 in. Dia) on all the holes of the outer doubler according to figure 401.
Reinstall the fasteners as you proceed.

NOTE: Do not rebores the pilot holes located on the frame in the procedure hereafter.

- (9) Rebores the pilot holes of the attachment holes in the panel to 5,21-5,31 mm diameter (0.205-0.209 in. Dia). Fasten as you proceed.
- (10) Remove the doublers. Deburr all the holes.

78-31-01

REP 1-460-17

Page 403

Apr 30/93

OLYMPUS 593

MK.610-14-28
OVERHAUL

E. Drilling in the outer doubler, in the stressskin panel and in the frames.

- (1) Position and fasten the outer doubler on the inner panel.
- (2) Position the assembly on the reverser bucket and install the fasteners at the frames level, starting by the centre working towards the extremities.
- (3) Rebore the pilot holes at the frames level to 5,21-5,31 mm diameter (0.205-0.209 in. Dia) starting by the centre and working towards the edges of the doubler. Install the fasteners as you proceed.
- (4) Remove the doubler and the inner panel. Deburr all the holes rebored.

F. Preparation of the parts to assemble.

- (1) Cut-out the edges of the doublers in function of the peripheral attachment holes according to figure 401.
- (2) Radius by draw filling the ridge of the doublers surface that must be in contact with the skin of the inner panel according to figure 401.
- (3) Clean the doublers according to procedure M101A of chapter 70-15-20 of standard practices.
- (4) Clean the reverser bucket and the inner panel according to procedure M116 of chapter 70-15-20 of standard practices.

G. Assembly.

- (1) Position and fasten the doublers on the inner panel (except at the frames level).
- (2) Install the blind rivets CR2838-6-7 in the centre of the panel according to chapter 70-50-50 and figure 401.
- (3) Check the installation of the rivets according to chapter 70-50-85.

78-31-01

REP 1-460-17

Page 404

Apr 30/93

OLYMPUS 593

MK.610-14-28

OVERHAUL

- (4) Weld a bead around the attachment bosses of the thermal shield with filler metal (P3030) according to chapter 70-35-10.
- (5) Check the weld beads according to chapter 70-35-80, class B2.
 - (a) Fluorescent penetrant inspect according to procedure M502B of chapter 70-20-10 of standard practices.
 - (b) Carry out a radiographic inspection according to chapter 70-20-30.
 - (c) The defects acceptance criteria are listed in chapter 70-35-80.
- (6) Position the reinforced inner panel on the reverser bucket structure, then install fasteners starting by the centre and working towards the edges.
- (7) Install the attachment parts of the inner panel on the reverser bucket structure starting by the centre working towards the edges.
 - (a) Install blind rivets at the level of the doubler according to chapter 70-50-50 and figure 401.
 - (b) Install the attachment parts at the frames level according to REP 1-460-3 of this present overhaul manual.
 - (c) Install the attachment parts at the trailing edge level according to REP 1-460-3 and 1-460-5 of this present overhaul manual.
 - (d) Install the attachment parts at the bosses level according to REP 1-460-2 and 1-460-3 of this present overhaul manual.
- (8) Check the installation of the attachment parts according to REP 1-460-2, 1-460-3, 1-460-5 and chapter 70-50-50 for the rivets CR2838-6.
- (9) Remove all the machining debris by suction through the borescope holes.

PARTS REQUIRED FOR REPAIR

Filler metal	P3030	(ND24FeC)
Powder	P3219	(Ni-Cr-Al 45-90 μ m)

- A. In the areas extremely worn, or of uneven profile, weld build-up area(s) with tungsten inert gas according to chapter 70-35-10, paragraph 2.
- (1) Filler metal: P3030 (ND24FeC)
- (2) Class of weld: A.
- B. Check build-up of class A weld according to chapter 70-35-80.
- C. Blend welded areas flush with surrounding material. Polish the area to be thermal-sprayed.
- D. Thermal-spray the contact surface of the leading edge panel according to figure 401 and chapter 70-65-20.
- (1) Powder P3219 (Ni-Cr-Al).
- (2) Thickness of deposit: 0.10 to 0.15 mm
(0.004-0.006 in.)
- E. Check thermal spraying according to chapter 70-65-80.
- F. Mark "REP 18" following the identification number of the part according to method M28 of chapter 70-10-10.

PARTS REQUIRED FOR REPAIR

Filler metal	P3030
Bar for bushing	P3601

A. Machining.

- (1) Machine out the thread insert housing by drilling to 10,30-10,35 mm (0.4055-0.4075 in.) diameter, according to figure 401.
- (2) Rebore the spacer plate and the hub to 11,250-11,268 mm (0.44291-0.44362 in.) diameter according to figure 402.
- (3) Chamfer the edges of the bore according to figure 402.

B. Machining of the Bushing.

- (1) Machine the bushing in the bar P3601 according to figure 403.

C. Installation of the Bushing.

- (1) Chill bushing in liquid nitrogen and install it in its housing according to figure 404.
- (2) Secure the bushing to the spacer plate by tungsten inert gas arc welding according to chapter 70-35-10.
 - (a) Filler metal: P3030.
 - (b) Welding class: B1.
- (3) Blend the weld bead flush into the profile of the spacer plate face.

ASSEMBLY

1. General

- A. During assembly, follow the general recommendations given in chapter 70-65-00 of the Standard Practices Manual and the working procedures of the Overhaul manual.
- B. Use only tools and other special equipment nominated in the assembly procedures and identified by a number SC... ; these tools are shown in the Illustrated Tools and Equipment Manual (I.T.E.M.)
- C. When assembling bolts and nuts, refer to pages 601-700 of the "Fits and Clearances" chapter for :
- (1) The tightening torque for the bolt or nut.
 - (2) The lubrication to be applied to the nut or the bolt before fitting.
- D. The clearances to be checked during assembly are identified by a number. Refer to pages 601-700 of the "Fits and Clearances" chapter for the values which must be complied with.
- E. In the working procedures section of the manual, parts are referenced to the IPL by two numbers in brackets, the first of which is the figure number in the IPL, the second being the item number within that figure.
- F. Torques should be applied with a torque spanner accurate to $\pm 5\%$.
- G. Shimming
- (1) Conditions related to the use of shims.

Shims may be employed in the case where adjoining of the various components necessitates the use of external loads liable to generate heavy stresses.
 - (2) Shim design characteristics.

Shim dimensions will be dictated by the overhaul requirements upon assembly of any new item.

NOTE : When shims are installed, it is essential to use shims made from the same material, at the same location.

T 40 (P3340)
T 50 (P3345)
Z 10 CNT 18 (P3301)
Z 8 CND 15 (PH15-7MO)

H. Fastener design characteristics

Fasteners required for joining the parts are detailed in the IPL taking into account the nominal thickness of the various components to be assembled.

Past experience shows that these thicknesses can vary thus rendering, in some cases, assembly work impracticable (tolerances on each component, zones locally collapsed on panels, cushioning effect...).

Therefore, during an assembly procedure it is permissible to mount fasteners whose lengths are different from the recommended ones.

Their type and diameter, however, must comply with the fastener design characteristics.

2. Assembling the Reverse Buckets

For each bucket, carry out the following operations :

NOTE : Assembly of the buckets is carried out with the buckets installed on the storage stand tool SC 37.

A. Installing the side plates.

(1) General

When side plates (1-110) and (1-50), external skin panels, doublers and spacer plates are adjoined (brought together), the permissible clearance shall not exceed 0,15 mm (0.006 in.) in zone X and at one of the locations shown in section A-A, Figure 1. The mechanical pressure induced by the tightening torque being not important enough due to friction (counter-sunk head screws), adjoining of the parts, before tightening the screws, will be carried out using clamps screwed by hand. The bearing points of the clamp jaws shall be applied within the fastening intervals. Use protective blocks to prevent damage to the parts.

OVERHAUL

- (2) Install the original side plate (1-110);
 - (a) Position the side plate (1-110) on the basic bucket (1-460) and secure it using bolts (1-160) inserted from the inner side of the bucket.
 - (b) Position the spacer plate (1-130) on the side plate external face and attach it using screws (1-120).
 - (c) Position the spacer plate (1-150) on the side plate external face and attach it using screws (1-140).

NOTE : Be careful to position the spacer plates (1-130) and (1-150) with their chamfered side against the side plate.

- (d) Tighten the screws to the prescribed torques.

- (3) Install the original side plate (1-50)
 - (a) Position the side plate (1-50) on the basic bucket (1-460) and secure it using bolts (1-100) inserted from the inner side of the bucket.
 - (b) Position the spacer plate (1-70) on the side plate external face and attach it using screws (1-60).
 - (c) Position the spacer plate (1-90) on the side plate external face and attach it using screws (1-80).

NOTE : Be careful to position the spacer plates (1-70) and (1-90) with their chamfered side against the side plate.

- (d) Tighten the screws to the prescribed torques.

- (4) Installing a new side plate (1-50)
 - (a) Position spacer plate (1-50) on the basic bucket (1-460).
 - (b) Check for correct alignment of side plate-to-basic bucket attachment holes for screws (1-80) and (1-60).

OLYMPUS 593

MK.610-14-28

OVERHAUL

NOTE : If holes are not aligned, elongate them slightly until attachment screws can be freely inserted and carry out assembly procedure as indicated below see fig. 2.

- (c) Position side plate (1-50) on the basic bucket (1-460) and secure it using bolts (1-100) inserted from the inner side of the bucket. Hand-tighten the bolts.
- (d) Install spacer plates (1-70) and (1-90) then, position screws (1-80) on spacer plate (1-90) and (1-60) on spacer plate (1-70).

NOTE : For the above operation, use slave bolts with a reduced diameter obtained by etching.

- (e) Place the bucket on fixture - tool SC 273 - and check the clearance dimension of $3,17 \pm 1$ mm (0.125 ± 0.04 in.), fig. 3. Adjust clearance within limits by addition of shims (1-105) and (1-107) if required. These shims are to be inserted between side plate and bucket hinge-point support, and bonded using CYANOLITE TYPE 202 (P496).
- (f) Check clearance again, once the assembly operation is completed and that the external screws (1-60) and (1-80) are tightened on spacer plates (1-90) and (1-70). Tighten the screws to be prescribed torques.

NOTE : Should several shims be required for a correct assembly, use shims made from the same material ; besides, they are not symmetrical.

CAUTION : NEVER USE SLAVE SCREWS FOR FINAL ASSEMBLY. SLAVE SCREWS SHALL BE CLEARLY IDENTIFIABLE.

- (5) Installing a new side-plate (1-110)
 - (a) Perform the same operations as above, using shims (1-165), (1-167), screws/bolts (1-160), (1-140) and (1-120) instead.
- (6) Using the side plate scribing gauge - tool SC 274 -, trace on side plates a radius of 247,50 mm (9.744 in.) from the hinge-point center (or hub) towards the side plate leading edge ; remove material in excess, deburr and round off. See Figure 4.

NOTE : No radial tools marks permissible.

B. Install the primary and secondary heat shields assemblies

- (1) Install cover assemblies (1-370) on the basic bucket (1-460). Tighten the screws to the prescribed torque. (Fig. 5).
- (2) Screw in the threaded sleeves (1-20) using the special wrench - tool SC 206 - and torque to the prescribed values.
- (3) Position the secondary heat shield (1-40) and locate it relative to the threaded sleeves.
- (4) Locate the primary heat shield assy (1-30) and secure it to the threaded sleeves (1-20) using the screws (1-10).
- (5) Pre-tighten screws (1-10) per sequence shown on figure 6. Tighten the screws (1-10) to the prescribed torque.
- (6) Check the $7 \begin{smallmatrix} + 2 \\ - 1 \end{smallmatrix}$ mm (0.275 - 0.236 in.) clearance between heat shield and side plate.

If not within limits :

- (a) Loosen the 28 screws and adjust final clearance by re-distribution of individual clearances (figure 6).
- (b) If clearance is still not within limits, remove the 28 screws and adjust as required.

1 After adjustment, break sharp edges by a 0,4 mm (0.016 in.) maximum chamfer.

2 Smooth out lengthwise using emery cloth.

NOTE : No radial tool marks permissible.

3 Re-install heat shield assemblies.

- (7) Tighten the screws to the prescribed torque per sequence given on figure 6.
- (8) Check the final clearance of $7 \begin{smallmatrix} + 2 \\ - 1 \end{smallmatrix}$ mm (0.275-0.236 in.)

C. Install the seal segments (figure 7)

- (1) Position the central seal segment (1-250) and secure it using screws (1-230) fitted with washers (1-240).

78-31-01

- (2) Position seal segment (1-220) and secure it using screws (1-200) fitted with washers (1-210).
- (3) Position seal segment (1-280) and secure it using screws (1-260) fitted with washers (1-270).
- (4) Position seal segment (1-310) and secure it using screws (1-290) fitted with washers (1-300).
- (5) Position seal segment (1-190) and secure it using screws (1-170) fitted with washers (1-180). Tighten slightly.
- (6) Comply with the maximum clearance requirement of 0,5 to 1 mm (0.020 - 0.039 in.) at four locations.
- (7) Either of these two cases will occur :
 - (a) The clearance is within limits : tighten to the prescribed torque.
 - (b) The clearance is not within limits thus entailing the rework of segment concerned. To this end, remove the screws and washers. Smooth out lengthwise using an emery cloth. Re-install the reworked seal segments and tighten the screws to the prescribed torque. Be careful to position the chamfer of the washers under the screw heads (figure 7).
- (8) Tighten the screws to the prescribed torque and check the final clearance (figure 7).

D. Install the bushings

- (1) Install the bushings (1-410) and (1-400) and hold them in position using a piece of brass wire.
- (2) Install the bushings (1-380) and (1-390) and hold them in position using a piece of brass wire.

E. Install the spherical bearing housings (1-340)

For each housing perform the following :

- (1) On the basic bucket, check the hinge-point support (hub) abutment faces :
 - (a) At the housing end of the support, using the housing itself, a set of feeler gauges and Prussian blue.

- (b) On the retaining nut end of the support, using a set of feeler gauges and Prussian blue.
- (2) Before installing the housing, lap the abutment face of the bucket hinge-point support (hub), if necessary, using lapping compound ABEILLE SC 400 (P270B) for rough finition and AOC 60 (P270C) for superfinishing. For external lapping use - tool SC 277, for internal lapping use - tool SC 278.
- (3) Check the abutment faces:
 - (a) At the housing end, using-tool SC 279.
 - (b) At the retaining nut end, using - tool SC 280.
- (4) From the inner side of the bucket, engage the spherical bearing housing (1-340), in its bore together with the positioning anti-rotation pin (1-360) (see figure 8), both parts coated of anti-seizure lubricant C200 (P209).
- (5) From the outer side of the bucket, position the non-lubricated retaining nut (1-330).
- (6) Screw up the nut and torque it to 2,8 daN.m (20.65 lb.ft); using a mallet, finish the positioning operation then, re-tighten to the prescribed torque value, using tool SC 40.
- (7) Check, using a set of feeler gauges, that both the spherical bearing housing and the retaining nut contact their support (bucket hub).
- (8) Deleted.
- (9) Position the spherical bearing (1-350) in its housing (1-340).
- (10) Remove excess of anti-seizure lubricant using a clean cloth moisted with acetone (P325) or methylethylketone (P422).
- (11) Lock the retaining nut (1-330) using the locking plates (1-320) as follows:
 - (a) Scribe the locations of the locking plates on the retaining nuts and on the spherical bearing housings (figure 9).

**FITS AND CLEARANCES****1. General****A. Layout**

- (1) The table of clearances gives the machining tolerances of parts in new condition and acceptable wear limits. The values are expressed in millimeters.

ITEM FIG.	IPL FIGURE ITEM	NOMINAL DIMENSION	TYPE	CLEARANCES		MAX LIMIT	CAT.	REMARKS SELECTIONS
				MIN	MAX			
1	2	3	4	5	6	7	8	9

- (2) The item numbers in column (1) by reference to the corresponding figure provide a means of locating the clearance or dimension to be measured.
- (3) The item numbers in column (2) identify the parts in the "Illustrated Parts List". (FIGURE + ITEM).
- (4) Column (3) gives the manufacturing dimensions of parts together with the machining tolerances.
- In the case of two parts which form an assembly the first one is always the male part.
- (5) The code letters in column (4) indicate the type of clearance.
- A denotes an axial clearance
 - D denotes a diametral clearance
 - L denotes a side clearance
- (6) Columns (5) and (6) give the clearance (symbol J) or the interference (symbol S) which result from the manufacturing tolerances.
- Column (9) is used to indicate that a smaller clearance than that resulting from the manufacturing tolerances is required. This reduced clearance is obtained by selective assembly of parts.

78-31-01

OLYMPUS 593

MK.610-14-28

OVERHAUL

- (7) The digits or letter in column (8) give the clearance category the definition of which is as follows :

M - Check or adjustment to be carried out at each assembly

- 1 - Check to be systematically carried out.
- 2 - Check to be carried out if the condition of parts makes it necessary.
- 3 - Dimensions intended for use by Design Offices (not applicable in this document).
- 4 - Check to be systematically carried out on the equipments intended for ageing studies (Sampling)

B. Max. after wear (column 7)

- (1) The MAX. LIMITS are the maximum wear limits within which a part can be accepted for a further period of use.
- (2) Parts worn beyond these limits will be either repaired in accordance with the instructions given in chapter "REPAIR" or replaced as applicable.
- (3) Therefore the values given in this column will change as experience is gained with the repaired equipment or the equipment intended for ageing studies.
- (4) This kind of information may be entered in this column.

(a) Clearance

The maximum clearance or the minimum interference between two parts will be given only if they are matched parts. The distribution of this clearance on the male or female part is left to the discretion of the repairer.

(b) Dimension

In order to preserve interchangeability, the degree of permissible wear on male and female parts is given, thus ensuring a correct assembly at all times whatever the mating parts may be.

OVERHAUL

STORAGE

1. General

The container used for storage and transport of the bucket is designed to conform to the requirements of category III ATA 300 specification, i.e., expendable package, but valid for at least one transportation trip.

The case is manufactured in 3 ply cardboard (Tri-wall), and comprises a double-skinned case with the walls separated by blocks of rubberised horsehair (rubber-crin). For transport, it is strapped to a pallet.

The bucket is mounted in what corresponds to the bottom position on the aircraft, and is retained by (see figure 901) :

- two mounting pins which engage in the bucket hinge points and are fixed to a wooden frame work,
- blocks of rubberised horsehair at the leading and trailing edges to avoid any swinging of the bucket.

Two positions are provided inside the container to house, if necessary, the deflectors.

The container must be handled with a fork lift truck.

2. Removal of the bucket from its container (see figure 901)

- A. Remove the straps which hold the case to the pallet.
- B. Cut the adhesive band which retains the lid to the outer casing.
- C. Remove :
 - (1) The outer case lid.
 - (2) The rubberised horsehair corner pieces and stiffeners.
 - (3) The inner case lid.
- D. Remove the wire locking the wing nuts on the mounting system.
- E. Slacken the wing nuts, and swing the eye-bolts to one side.
- F. Withdraw the mounting pin locking brackets.

OVERHAUL

- G. Position the lifting beam - tool SC 205 - to the bucket and secure it at the deflector mounting points.
- H. Using a hoist, remove the bucket from its container and place it on the storage fixture - tool SC 37.
- J. Remove the mounting pins and the lifting beam - tool SC 205 -
- K. If the container is to be returned empty, proceed as follows:
 - (1) Fit the mounting pins, the locking brackets and the wing nuts.
 - (2) Fit the inner lid, the rubberised corner pieces and spacers, and the outer lid.
 - (3) Fix the outer lid by sticking adhesive tape all round the circumference.

3. Placing the bucket in its container

- A. Open the container and check that it is not damaged.
- B. Remove the locking brackets and the mounting pins.
- C. If necessary, fit the deflectors and their bolting in the appropriate compartments in the container.

NOTE : The deflectors are to be cleaned with white spirit and dried before storage.
- D. With the bucket on the storage stand - tool SC 37 - fit the lifting beam - tool SC 205.
- E. Using a hoist, lift the bucket from the storage stand - tool SC 37.
- F. Clean the bucket as follows :
 - (1) Degrease the bucket assembly using a rag soaked in white spirit (P 129)
 - (2) Wipe with a clean, dry rag to eliminate any trace of the degreasant, and ensure that any dribbles are removed.

78-31-01

Page 904

OLYMPUS 593

MK.610-14-28

OVERHAUL

- (3) Immediately after cleaning and drying, apply to the stressskin panels only, a protective mixture comprising

- (a) 50% isopropyl alcohol (P 442)
- (b) 50% phosphoric acid (P 8A) diluted to 60%

NOTE : For this operation, use gloves and protect the eyes. Apply the protective liquid, as evenly as possible with a brush to all the stressskin surfaces to be protected.

- G. Fit the mounting pins to the bucket. Enter them into the spherical bearings from the outside.
- H. Operate the hoist to lower the bucket into the container taking care to :
 - (1) Place the leading edge opposite the mark (red paint) on the support frame.
 - (2) Ensure that the mounting pins are correctly engaged in the slots in the support frame.
- J. Remove the lifting beam -tool SC 205.
- K. Fit the mounting pin locking brackets and the wing nuts.
- L. Tighten the nuts and wire-lock them in pairs.
- M. Place all the technical documents relevant to the stored bucket (Log book, release notes etc...) in the documents box (between the inner and outer cases).
- N. To close the container
 - (1) Fit the inner case lid.
 - (2) Position the rubberised corner pieces and stiffeners.
 - (3) Fit the outer case lid and fix it to the outer case with adhesive tape all around the circumference.
 - (4) Secure the container to the pallet using the two straps.

78-31-01

Page 905
Dec 30/74

OLYMPUS 593

MK.610-14-28

OVERHAUL

- P. Place the customs documents in the external box.
- Q. Stencil onto the black rectangle on the container :
- the bucket number
 - the packaging date
 - the storage life

4. Storage life

A. In the container

If the conditions of containersation described in the preceding paragraph have been respected, and the container is sheltered from sunlight and bad weather, the storage life is 3 months maximum.

B. Out of the container

- (1) Envelope the bucket in a non-hermatic, anti-dust polythene bag.
- (2) If the humidity is less than 60 %, inspect the parts every 3 months; if greater than 60 % a monthly inspection is required.
- (3) If the onset of corrosion is noticed, clean and renew the protective coating as per paragraph 3.

OVERHAUL

INTRODUCTION

1. Purpose

This illustrated parts list gives a complete list of the components required for the overhaul of an equipment.

2. Illustrated parts list

The illustrated parts list is divided into three parts :

- Introduction
- Numerical index
- Detailed parts list

A. Numerical index :

For the sake of clearness, this repertory is divided into two parts :

- (1) Index of manufacturers references beginning with a letter.
- (2) Index of manufacturers references beginning with a figure.

These indexes include all the manufacturers references for the parts described in the detailed nomenclature in alphabetical or numerical order. Opposite each reference is given the chapter-section-subject-figure-item number and the quantity.

B. Detailed parts list.

The detailed parts list gives, in disassembly order, the list and illustrations of the parts making up the assembly concerned from the origin as shown in the example paragraph B6 effectivity.

- (1) Items index numbers.

To allow simple and speedy identification, each item is given a numerical item in 10 to 10 sequence, this item will not vary during the whole life of the item.

- (2) Original item.

To cater for systematic evolution due to modifications a "letter" variant is added to the numerical item. The letter variant "A" is given in the original document to identify all the items in original definition.

78-31-01

It is given in the text part only.

(3) Modified item (Item variant).

After each modification concerning an item, the numerical item of this item is maintained but the "letter" variant progresses systematically to "B", then "C", "D" etc. (letters I, O and X are not used). This variant evolution is shown in the text and on the drawings only in the case of a change. The use of the "letter" variant added to the numerical item has been made necessary to make possible the rational use of the "effectivity Code" (usage code) such as it is presented paragraph 6 of this foreword.

(4) Indent

The detailed nomenclature is presented indented showing the relation between the various items, i.e :

1	2	3	4	5	6	7
Assembly						
	Assembly component parts					
	Sub-assembly					
	Sub-assembly attachment parts					
	*	*	*			
	Sub-assembly component parts					
	Sub sub-assembly					
	Sub sub-assembly attachment parts					
	*	*	*			
	Sub sub-assembly component parts					

(5) Quantity per assembly

The quantity indicated in the "Quantity per assembly" column is that required by the next higher assembly.

(6) Effectivity

A coded method is used to indicate parts effectivity. This alphanumerical code indicates the installation possibilities of sub-assemblies and primary parts in relation to the next higher sub-assembly or assembly. The validity column is left blank when installation is possible in all cases.

78-31-01

This code corresponds to the next higher assembly or sub-assembly item.

Figure Item	Manufacturers Reference	Description							Effectivity
		1	2	3	4	5	6	7	
1A	123450	Assembly							
1B	123451	Assembly (SB 1)							
1C	123452	Assembly (SB 2)							
1D	123453	Assembly (SB 3)							
10A	234560	. PRIMARY PART							1A
10B	234561	. PRIMARY PART (BS 1)							1BAC
10C	234562	. PRIMARY PART (BS 3)							1D
20A	345670	. SUB-ASSEMBLY							1A
20B	345671	. SUB-ASSEMBLY (BS 1)							1BAC
20C	345672	. SUB-ASSEMBLY (BS 2)							
20D	345673	. SUB-ASSEMBLY (BS 3)							
		. ATTACHING PARTS							
30A	456780	. PRIMARY PART							
		* * *							
40A	567890	. . PRIMARY PART							20A
40B	567891	. . PRIMARY PART (BS 1)							20BA
40C	567892	. . PRIMARY PART (BS-2)							20CAB
40D	567893	. . PRIMARY PART (BS 3)							20D

The above example shows that :

- The primary part index 10A can only be installed in assembly indexed 1A.
- The primary part index 10B can be installed in assemblies indexed 1A, 1B, and 1C.
- The primary part index 10C can only be installed in assembly indexed 1D.
- The sub-assembly index 20A can only be installed in assembly indexed 1A.
- The sub-assembly index 20B can be installed in assemblies indexed 1A, 1B and 1C.
- The sub-assemblies indexes 20C and 20D and their attaching parts indexed 30A can be installed in all assemblies indexed 1 and thus do not have an "effectivity" code.
- The primary part index 40A can only be installed in sub-assembly indexed 20A.
- The primary part index 40B can be installed in sub-assemblies indexed 20A and 20B.

78-31-01

OLYMPUS 593

MK.610-14-28

OVERHAUL

- The primary part index 40C can be installed in sub-assemblies indexed 20A, 20B and 20C.
- The primary part index 40D can only be installed in the sub-assembly indexed 20D.

(7) Figure Variant

When it is not possible to illustrate the different variants of an assembly, resulting from modifications to the basic figure, one or several supplementary illustrations will describe these variants.

These supplementary illustrations will bear the same number as that of the basic figure, followed by a letter taken in the alphabetical order (except I and O).

Whatever the number of figure variants, they will be covered by only one nomenclature.

To ascertain quickly on which figure variant the item variant is to be found, the figure variant letter will be indicated in the nomenclature, in the "index reference figure item" immediately in front of the item number.

3. Using the illustrated nomenclature

The identification of a component is possible taking the following elements in consideration :

A. Through the manufacturer's reference.

Search for the manufacturer's reference in the numerical index, note the chapter-section-subject-figure-item number and refer to the corresponding nomenclature.

B. At sight of the component, without knowing its references.

Look for the figure showing the component among the illustrations this will indicate the item permitting reference to the detailed nomenclature.

OIL SYSTEM STORAGE - INSPECTION/CHECK

1. General

- A. Each item in this chapter is given a two-part identification; thus, 302-20 refers to Figure 302 and to Item 20 called out on that figure. Each item may be further identified by its Part Number by the use of Table 303, which cross-refers figures in this chapter to the equivalent chapter and figure in the Illustrated Parts Catalogue (I.P.C.); the called-out item number will be the same on both figures.
- B. All items which will be crack tested are listed in Tables 301 and 302.
- C. Dimensional checks are cross referenced to the equivalent Fits and Clearances Schedule (F.C.S.) chapter against the item concerned.
- D. When the inspection of an item discloses a minor defect that requires rectification, it is defined as 'Accept after repair'. On all such occasions the item must be rectified in accordance with Standard Practices 72-09-22 Repair. Where a Ref.No. follows 'Accept after repair' e.g. (Ref.72-21-01 Repair No.1), a specific Repair Scheme is available to which the item must be rectified. Items that are rejected, or for which a repair scheme is not currently available, should be held at the discretion of the operator, as service experience may prove the need for a repair.
- E. On completion of a repair, rectification or test, the item(s) must be inspected, to ensure that the necessary work has been satisfactorily completed.

2. General Inspection

- A. Inspect all items illustrated in this chapter, whether specified or not, in accordance with Standard Practices (Ref.72-09-00 Inspection/Check). In addition, carry out the inspections detailed for the specified items, from para.4 onwards.
- B. Inspection terms used in this chapter are explained in Standard Practices (Ref.72-09-00 Inspection/Check).

3. Crack Detection

- A. Magnetic Particle Crack Detection.

- (1) Submit the items listed in Table 301 to crack detection in accordance with the process quoted.

INSPECTION/CHECK

Cross References to Illustrated Parts Catalogue
Table 3034. Oil Tank (303-10)

A. Inspect Tank Shell.

- (1) Cracks. Reject.
- (2) Dents.
 - (a) Dents of smooth contour, with no impact marks, clear of corners or edges. Accept.

B. Inspect Location Faces.

- (1) Inspect wire thread inserts (Ref.72-09-00 Inspection/Check).
- (2) Nicks, scores and burrs. Accept, if repair preserves sealing capability.
- (3) Wear and fretting.
 - (a) Bolt holes elongated not more than 0.030 in. (0,760 mm). Accept after repair.

OVERHAUL

(4) Distortion.

(a) Any detectable distortion Reject.
or misalignment.

C. Inspect Filter Location.

NOTE: Carry out this inspection in conjunction with
the filter (302-340).

- | | |
|--|--|
| (1) Nicks, burrs and scores at
filter inner location bore. | Accept, if repair
preserves profile
and sealing
capability. |
| (2) Wear and fretting at outer
end of filter location
bore. | Accept, if repair
preserves profile
and sealing
capability. |
| (3) Nicks and burrs at spring
retainer location and retaining
ring groove. | Accept after
repair. |

D. Test Tank (Ref.79-11-00 Testing).

5. Mounting Brackets (303-120 and 230) and Link (303-60);
Stiffener Plate (303-180)

A. Inspect all Items.

(1) Distortion. Reject.

B. Inspect Attachment Faces of Brackets and Link and Hollow
Pin Location Bore of Link.

(1) Nicks and burrs. Accept, if repair
preserves surface
flatness and
profile of bore.

(2) Wear and fretting.

(a) Bolt-holes or link bores Reject.
elongated not more than
0.010 in. (0,250 mm).

6. Filter Housing (302-130) and Cover (302-170)

A. Inspect Both Items.

(1) Distortion.

Reject.

B. Inspect Housing/Cover Location Bore/Diameter.

(1) Nicks, burrs and scores.

Accept, if repair preserves profile and sealing capability.

C. Inspect Filter Locations.

(1) Nicks and burrs.

Accept after repair.

D. Inspect Gasket Abutment Face on Filter Housing.

(1) Nicks, burrs and scores.

Accept, if repair preserves surface flatness and sealing capability.

7. Vent Valve Housing (302-70) and Housing (302-200)

A. Inspect Abutment Faces, Seal Location Groove, Liner and Vent Valve Location Bores, valve seat insert and Bushing Sleeve Bore.

NOTE: Check the bushing sleeve in conjunction with the vent valve 302-60 in para.8.

(1) Nicks and burrs.

Accept, if repair preserves profile and surface flatness.

(2) Valve seat insert.

(a) Inspect insert secure in housing.

Accept, after locking repair to improved standard, refer to SB.79-8757-16.

B. Inspect Thread Inserts (Ref.72-09-00 Inspection/Check).

8. Vent Valve (302-60)

A. Inspect Contact Faces (Ref.Fig.306).

NOTE: Carry out this inspection in conjunction with the vent valve housing (302-70) in para.7.

(1) Nicks and burrs.

Accept, if repair retains profile and sliding fit in bushing sleeve.

INSPECTION/CHECK

OVERHAUL

(2) Wear and fretting.

(a) Step at inner end
abutment face and at
bellows contact face.

Accept after repair
if location is
maintained.

(3) Check valve for rocking in bushing sleeve.

NOTE: Make this check with a new or unworn
vent valve housing. Finally select a valve
and vent valve housing that are compatible
and retain as a set for assembly.

(a) Snug fit, with no rocking. Accept.

9. Liners (302-80 and 90)

A. Inspect Liners.

(1) Nicks and burrs.

Accept, if repair
preserves 90 per
cent contact area.

10. Bellows Assembly (302-20)

A. Dimension Check (Ref. Fig.308).

(1) Overall length
2.380/2.340 in.
(60,45/59,44 mm).

Accept.

(2) Free movement
0.330/0.260 in.
(8,38/6,60 mm).

Accept.

B. Leakage Check.

NOTE: The bellows must be restrained at its free
state dimension (Ref. Fig.308) during the
check.

(1) Pressurize the bellows internally to 65/70 p.s.i.
(448/483 kPa) and immerse in kerosene, white spirit
or soapy water. No leaks are acceptable.

(2) Dry bellows thoroughly, and apply de-watering oil.

INSPECTION/CHECK

79-10-00

Page 307

MK.610-14-28
OVERHAUL

C. Bellows Rate Check.

NOTE: The bellows must be vented to atmosphere during the check.

- (1) Check the bellows rate over the full range of free movement (Ref. Fig.308). The rate must be between 20 and 26 lbf/in. (3,50 and 4,55 N/mm.). Reject the bellows if outside these limits.

11. Adjusting Plate (302-40)

A. Inspect Abutment Faces.

NOTE: This item is selected during initial assembly. Ensure that it is retained with its original bellows and vent valve.

- (1) Nicks, burrs and scores.

Accept, provided that repair preserves surface flatness and that designed effective thickness is maintained over 90 per cent of contact face area.

- (2) Fretting and wear.

Reject.

12. Cover (302-250)

A. Inspect Abutment Face.

- (1) Nicks and burrs.

Accept, if repair preserves surface flatness and sealing capability.

B. Inspect Tube.

- (1) Distortion and dents.

Accept, after repair if ball (302-280) moves freely in tube.

13. Ball (302-280)

A. Inspect Surface.

- (1) Nicks and burrs.

Accept after repair

14. Spring Retainer (302-330)

A. Inspect Locating and Spring Contact Faces.

- (1) Nicks and burrs, wear
and fretting.

Accept, if repair
preserves flatness
and profile.

15. Filter Assembly (302-340)

A. Inspect Screen.

- (1) Punctures, tears or separation
from cage.

Reject.

B. Inspect Cage.

- (1) Cracks or distortion.

Reject.

- (2) Nicks, burrs and scores.

Accept, if unbroken
contact is retained
after repair.

- (3) Wear and fretting.

Accept, if sealing
unimpaired.

- (4) Spring security.

- (a) Spring detached from cage,
or loose at attachment
point.

Accept after
repair.

16. Internal Stiffeners (303A)

A. Inspect Rear Stiffener Flanges.

- (1) Cracks.

- (a) Cracking over full length
of top of flange at spot-
welded locations.

Accept, provided that
cracks do not
propagate into web
of stiffener.

INSPECTION/CHECK

- (b) Cracking in outboard flange at spot-welded locations.

Accept, provided that cracks do not exceed half the length of the outboard flange and do not propagate into web of stiffener.

B. Inspect Centre Stiffener Flanges.

- (1) Cracks over the full length of all flanges

Accept, provided that cracks do not propagate into web of stiffener.

C. Inspect Front Stiffener Flanges.

- (1) Cracking in all flanges

Accept, provided that cracks do not exceed half the length of the outboard flange and do not propagate into web of stiffener.

17. Pressure Cap Assembly (304-10)

A. Inspect Cap.

- (1) Check condition of Metaseal ring on seal carrier.

- (a) No damage to faces or insert; seal secure in carrier; sealing capability unimpaired.

Accept.

- (2) Check circlips - two off.

- (a) Displaced from locating grooves.

Accept after repair if otherwise serviceable.

- (3) Nicks and burrs.

Accept, if operation is satisfactory after repair (para.B).

OVERHAUL

B. Check Operation (Ref.Fig.307).

NOTE: Carry out this check after the inspection of, and in conjunction with the Fill/Drain Connection 304-60 (para.18).

- (1) Temporarily locate Fill/Drain Connection to suitable rigid base, such as mounting face on tank.
- (2) Ensure that locking sleeve is in unlocked condition, by turning counter-clockwise until locking pin is at top of cut-out in sleeve.
- (3) Push cap fully home, against spring pressure, on end of connection; rotate sleeve clockwise until locking pin is in lower location of cut-out.
- (4) Give sharp pull on cap without rotating sleeve to confirm that locking balls are located in connector groove.
- (5) Turn locking sleeve counter-clockwise to unlocked position at same time withdrawing cap from connection. Ensure locking pin is at top of cut-out.
 - (a) Balls engaged and cap secure; cap removable from connection. Accept.

C. Check Lanyard and Locking Tab.

- (1) Security.
 - (a) Lanyard broken or frayed; tab missing; retaining ring damaged. Accept after repair or replacement.

D. Test Pressure Cap for Leakage.

- (1) Connect the Pressure Cap to a test nipple with its valve assembly removed. Apply a pressure of 2 p.s.i.g. (13,79 kN/m²) with the pressure cap totally submerged in water. There must be no air leakage.
- (2) Increase the test pressure to 5 p.s.i.g. (34,47 kN/m²). An intermittent leakage is allowed.

18. Fill/Drain Connection Assembly (304-60)

A. Inspect Gasket Abutment Face.

(1) Nicks and burrs.

Accept, if repair preserves surface flatness.

B. Inspect Pressure Cap Contact Faces.

(1) Nicks and burrs.

Accept, if repair preserves profile and operation is satisfactory (para.17B).

C. Inspect Pressure Cap Seal Location Bore.

(1) Nicks and burrs.

Accept, if repair preserves sealing capability.

D. Inspect Valve Seat Face.

(1) No damage to face.

Accept if sealing capability is unimpaired.

E. Inspect Locking Balls Locating Ring.

(1) Nicks and burrs.

Accept, if repair preserves ring profile.

F. Check Operation (Ref.Fig.307).

(1) Depress valve against spring. Check that valve moves smoothly in connection bore. Check that spring valve seats squarely on contact face when released.

(a) Smooth movement of valve, with full contact on closure.

Accept.

(2) Check pressure cap is locking satisfactorily (Ref.para.17).

G. Test for Leakage.

- (1) Connect the flanged end of the nipple to a suitable test rig. Apply a pressure of 3 to 4 p.s.i.g. (20,55 to 27,58 kN/m²) with air under water. Maintain for a period of 2 minutes. An intermittent leakage of bubbles is allowed.
- (2) Relieve pressure. Slowly apply a pressure of 10 p.s.i.g. (68,95 kN/m²) and repeat test as in para. (1). An intermittent leakage of bubbles is allowed.
- (3) Relieve pressure and remove the nipple from the test rig. Remove the excess water and place the nipple in a drying oven for a period of 30 minutes at a temperature of 100°C to 110°C.
- (4) Test Socket Assy for Leakage.
 - (a) Connect the rear (screwed termination) of the socket to a suitable air test rig. Completely immerse the socket in water and apply an air pressure of 3 to 10 p.s.i.g. (20,55 to 68,95 kN/m²). There must be no air leakage from any part of the socket, as will be evident by the presence of air bubbles.
 - (b) Connect the socket to a serviceable mating nipple. Blank nipple termination. Immerse the coupling in water and apply an air pressure in increments from 5 to 10 p.s.i.g. (34,47 to 68,95 kN/m²). There must be no leakage from any part of the coupling.

19. Overflow Drain Cable Assembly (305-15)

NOTE: The overflow drain cable assembly includes the screwed plug to which the cable is attached.

A. Inspect Threads (Ref.72-09-00 Inspection/Check).

B. Inspect Plug.

(1) Seal face damaged.

Reject.

(2) Cable groove.

(a) Cable displaced from groove.

Accept after repair if otherwise serviceable.

C. Check Cable and Locking Tab.

(1) Security.

- | | |
|--|---|
| (a) Cable broken or frayed;
tab missing; retaining
ring damaged. | Accept after
repair or
replacement. |
|--|---|

20. Screwed Plug (305-25)

A. Inspect Threads (Ref.72-09-00 Inspection/Check).

B. Inspect Seal Abutment Faces.

- | | |
|------------------------------|---|
| (1) Nicks, burrs and scores. | Accept, if repair
preserves surface
flatness. |
|------------------------------|---|

21. Mounting Brackets (302-50, 304-30 and 304-40)

A. Inspect Brackets.

(1) Wear and fretting.

- | | |
|--|-------------------------|
| (a) Attachment face thickness
reduced by not more than
5 per cent. | Accept. |
| (b) Bolt-holes elongated not
more than 0.030 in.
(0,760 mm). | Accept after
repair. |

(2) Scoring.

- | | |
|---|--|
| (a) Not more than 0.010 in.
(0,250 mm) in depth. | Accept after repair
providing material
thickness is not
reduced by more
than 5 per cent. |
|---|--|

- | | |
|----------------------|-------------------------|
| (3) Nicks and burrs. | Accept after
repair. |
|----------------------|-------------------------|

- | | |
|-----------------|---|
| (4) Distortion. | Accept if
compatibility is
preserved. |
|-----------------|---|

MAIN OIL TANK - DISASSEMBLY

1. General

- A. Prior to commencing disassembly, refer to 72-09-00 Disassembly for general information.
- B. Throughout the text special tools are quoted by their Ref.No. e.g. (Tool 1234). For a complete list of tooling required for the disassembly of the oil tank and for the Manufacturers Part No. refer to the Special Tools, Fixtures and Equipment, Table 1001.

2. Prepare the Oil Tank for Disassembly

- A. Assemble the Oil Tank to the Stand (Ref. Fig.101).
 - (1) Place the oil tank on the bench with its mounting brackets uppermost.
 - (2) Remove the support frame (Tool 673) from the stand (Tool 482) by unscrewing the four hand nuts on the cradle.
 - (3) Secure the support frame to the oil tank with a slave nut and bolt at the front and lower bracket locations, and two slave bolts at the rear upper bracket location.
 - (4) With the stand cradle in the vertical position, lift the oil tank and support frame, then, with the base (larger end) of the oil tank downwards, locate the support frame over the four retaining hooks on the cradle and tighten the hand nuts.

3. Disassemble the Oil Tank (Ref. Fig.103)

- A. Remove the Drain Plug.
 - (1) Remove the lockwire, then unscrew and remove the drain plug. Allow any surplus oil to drain from the oil tank, then assemble the screwed protector (Tool 918) into the drain plug location.
- B. Remove the Negative 'G' Ball Valve.
 - (1) Unscrew and remove the eight retaining bolts from the cover.

OVERHAUL

- (2) Rotate the cover through 180 degrees allowing the ball within the tank to drop into the cup, then carefully withdraw the cover and ball.
 - (3) Remove the gasket, then assemble the protector (Tool 919) to the ball valve location and secure with its two retaining bolts.
- C. Remove the Vent Valve/Filter Assembly, (Ref. Fig.102).
- (1) Withdraw the locking pin from the stand, then turn the oil tank to the horizontal position and replace the pin.
 - (2) Unscrew and remove the two bolts securing the vent valve mounting bracket to the oil tank, then slide the vent valve off the filter housing.
 - (3) Remove the locking wire, then unscrew and remove the four bolts securing the bellows unit to the vent valve housing. Withdraw the bellows, then remove the adjusting plate, sealing washers and mounting bracket. Withdraw the valve from the housing.
 - (4) Unscrew and remove the remaining 18 bolts which retain the filter housing. Screw three slave bolts ($\frac{1}{4}$ 28 UNF) into the extracting holes in the filter cover and withdraw the cover from the tank.
 - (5) Assemble the protector (Tool 677) to the vent valve filter location on the oil tank and secure with the four retaining bolts.
 - (6) Dismantle the filter assembly (Pre SB.79-9 only).

NOTE: Do not dismantle the filter assembly unless the cover/housing joint leaks, it is suspected that the filter is contaminated, or with the filter dished towards the cover assembly, the clearance between the deflector cover and the filter is not between 0.625 in. (15,87 mm) minimum and 0.875 in. (22,22 mm) maximum.

- (a) Drill out the three rivets which secure the deflector cover to the filter cover, then withdraw the deflector cover and filter.
- (b) If leakage has occurred from the cover/housing joint, unscrew and remove the six bolts securing the housing, then remove the housing and gasket.

DISASSEMBLY

79-11-01

Page 104

OVERHAUL

D. Remove the Inspection Cover.

- (1) Unscrew the eight retaining bolts and remove the inspection cover and gasket.
- (2) Assemble the protector (Tool 678) to the inspection cover location on the oil tank and secure with the two retaining bolts.

E. Remove the Filler/Drain Coupling.

- (1) Remove the pressure cap from the filler/drain coupling by rotating the outer sleeve and withdrawing it locating the pegs in the slots of the sleeve.
- (2) Unscrew and remove the five retaining bolts then remove the coupling and brackets. Assemble the protector (Tool 680) to the flange and secure with the two retaining bolts.

F. Remove the Overflow Drain Plug S.B.79-6.

- (1) Remove the oil sampling plug locking wire then unscrew and remove the plug and seal. Remove the locking wire from the overflow drain plug, unscrew and remove both plug and seal.
- (2) Screw the threaded protector (Tool 681) into the overflow drain plug location.

G. Remove the Contents Transmitter.

- (1) Remove the locking wire, then unscrew and remove the eleven bolts to release the transmitter and carefully withdraw the transmitter from the tank. Remove the gasket.
- (2) Assemble the protector (Tool 917) to the contents transmitter location on the oil tank and secure with the three retaining bolts.

H. Remove the Filter.

- (1) Press in the filter retaining plate to compress the spring, then remove the retaining ring and withdraw the retainer and filter.
- (2) Assemble the protector (Tool 676) to the oil feed flange, then ensure that the protector (Tool 916) is assembled to the oil return flange.

I. Remove the Mounting Brackets.

- (1) Remove the oil tank from the stand.
 - (a) With the oil tank positioned vertically, unscrew the four hand nuts which secure the support frame to the cradle.
 - (b) Lift the support frame and oil tank from the cradle and carefully place them on the bench with the support frame uppermost.
 - (c) Remove the nuts and bolts securing the support frame to the oil tank mounting brackets, then remove the frame.
- (2) Remove the rear upper mounting bracket by unscrewing and removing the two nuts and bolts which secure it to the oil return flange.
- (3) Remove the rear lower mounting bracket by unscrewing and removing the four nuts and bolts which secure it to the oil feed flange.
- (4) Remove the front lower link by unscrewing the bolt which secures it to the oil tank boss, then remove the hollow pin from the link.

NOTE: The disassembly of the oil tank is now complete and the tank and its components can be despatched for cleaning.

OLYMPUS 593
MK. 610-14-28
OVERHAUL

OIL TANK - CLEANING

1. General

- A. Prior to commencing the cleaning refer to 72-09-00 Cleaning for details of the cleaning processes referred to in Table 201.
- B. To ensure that all items within this breakdown that require cleaning and subsequent Inspection/Check are recognized, and identified by their Part Number, figures are provided which equate with the Illustrated Parts Catalogue (I.P.C.). Thus, Fig. 201 Item 10 equates with the relevant Figure and Item Number in the same breakdown in the I.P.C. Items illustrated in the I.P.C. which are not illustrated in this breakdown, are those items which are either discarded at overhaul, or are normally assembled to another item and are only called up by number.
- C. As all items requiring cleaning are illustrated in the figures, Table 201 does not list all items, but deals collectively with the items requiring the same cleaning process.
- D. On receipt of the items from disassembly, all protective blanks, covers etc. deemed necessary for the protection of the items will have been assembled and, in addition, many of the items will arrive in containers. Any special containers, blanks, covers etc. are listed in Table 202 by their Tool Ref. No. (Tool 123). For the manufacturer's Part No. refer to the appropriate Table in Special Tools, Fixtures and Equipment Section.

2. Cleaning Components

- A. All blanks, covers etc. must be removed from the items prior to cleaning and reassembled immediately afterwards. Items received in special cleaning containers should remain therein during the cleaning procedures unless otherwise stated.
- B. All items contained in this breakdown must be cleaned by the appropriate processes quoted in the table, to achieve a cleanliness to enable the Inspection/Check to be carried out correctly. Where alternative processes are quoted, the operator must decide what process to use depending on the amount of contamination of the item. Any item that is not cleaned satisfactorily must be recleaned by the appropriate process.

OVERHAUL

- C. When an assembly item has attached parts that have certain protective finishes e.g. silver plating, the cleaning process for the assembly item may damage the finish of the part. To minimize the effect on the finish of the part, reduce the process immersion time to a minimum. If the finish is damaged, then the damaged finish will have to be replaced or reconditioned.

2. REPAIR LIMITATIONS

Compliance with all aspects of this repair process should be achieved without deviation. Where a need to deviate is considered necessary, reference should be made to the Repair Authority for agreement.

3. GENERALUNLESS OTHERWISE SPECIFIED

Drawing practice & tolerance interpretation to ISO1101 (JES160)

Dimensions in Inches (Millimetres)

Tolerances on machined dimensions plus/minus 0.010 (0,25)

Tolerance on angles plus/minus 2 degrees

Break sharp edges 0.004 to 0.020 (0,1 to 0,5)

Surface texture interpretation to ISO1302 (JES137)

Surface texture to be 125 (3,2) Microinches (Micrometres)

Welding symbols to ISO2553 (JES139)

3rd Angle Projection

4. REPAIR PROCEDURESUPPLEMENTARY INFORMATION

- 1) Mask off bosses and holes etc. with blanks and fill tank with clean 1.1.1. Trichloroethylene (Triklone N). Heat at 90°C for 10 minutes in a vapour degreasing tank.

Use OMat 1/21.
Note. Use the same type of solvent as contained in the vapour degreasing tank to be used.

- 2) Empty tank and remove blanks.

- 3) Vapour degrease tank.

Refer TSD 594 OP.101

OVERHAUL

- 4) Blow through tank with clean, dry, compressed air.
- 5) Stove at 120°C for 10 minutes.
- 6) Inspect stiffener flanges adjacent to the oil separator mounting flange and determine extent of cracking.
- 7) Mark out areas of skin to be removed. Refer fig.401
- 8) Visually inspect to ensure that no previous identity marking(s) will be lost. If marking(s) will be lost (or obscured), record and retain for re-marking at op.50). Refer fig.403 for identity marking area.
- 9) Cut away to remove area of skin, allowing sufficient material to dress back to marked outline. **NOTE:** Do not impair flange material under skin section.
- 10) Release skin from internal stiffener by grinding through spot weld nuggets and remove skin.
- 11) Fluorescent penetrant inspect the internal stiffener flange areas immediately adjacent the aperture for cracks. Refer TSD 594 OPS.210 or 213.
- 12) If further cracking is evident, extend the aperture size until all signs of cracking are removed. **NOTE:** Repeat op.8).
- 13) Trim the aperture and remove the cracked flange section from the stiffener. Refer fig.401 to 403
- 14) Trim the existing stiffener flange at each end of the aperture for a distance of 0.250(6,35). Refer fig.402
- 15) Fabricate a stiffener locating flange section. Make from 22 SWG MSRR8608 Refer fig.404

REPAIR

OVERHAUL

- 16) Produce 0.125(3,18) dia. holes at 0.500(12,70) centres in replacement flange section. Refer fig.404
- 17) Produce a closing patch to suit contour of tank. Make from 20 SWG MSRR8608
Ensure fit of patch in relationship to aperture is of close tolerance to minimise shrinkage when welding. Refer fig.404
- 18) Locate replacement flange section and patch temporarily on tank and mark where centre of flange corresponds in relation to the patch.
- 19) Using the position marked at op.18) produce 0.125(3,18) dia. holes at 0.500(12,70) centres in patch. Refer fig.404
- 20) Heat treat replacement flange section and patch at 650°C for 1 hour.
- 21) Fluorescent penetrant inspect the replacement flange section and patch for cracks. Refer TSD 594 OPS.210 or 213.
- 22) Thoroughly clean the existing stiffener and replacement flange section using abrasive matt in preparation for welding. Refer TSD 594 OP.409
Use OMat 583.
- 23) Degrease existing stiffener and replacement flange section prior to welding. Refer TSD 594 OP.101
- 24) Locate replacement flange section in position on existing stiffener then clamp to secure.
- 25) Tack weld replacement flange section to existing stiffener. Refer TSD 594 OP.409
Use filler rod OMat 366.
- 26) Remove clamps and check for position by temporarily fitting patch. Adjust the position of the replacement flange section (if necessary).

2. REPAIR LIMITATIONS

Compliance with all aspects of this repair process should be achieved without deviation. Where a need to deviate is considered necessary, reference should be made to the Repair Authority for agreement.

Direct welding of fretting/damage is limited to a maximum depth of 50% of the gauge thickness of the individual tube.

Maximum size of repairable fret/damage mark to be contained within an envelope measuring 0.350 x 0.350 (8,90 x 8,90) (Refer fig.401).

Fretting/damage up to 0.003(0,08) in depth may be repaired by blending (light dressing). Fretting/damage in excess of 0.003(0,08) shall be repaired by welding.

Repair by blending (light dressing) may be embodied once only.

3. GENERALUNLESS OTHERWISE SPECIFIED

4. REPAIR PROCEDURE

SUPPLEMENTARY INFORMATION

A. REPAIR BY BLENDING.

- 1) Lightly hand dress to remove any sharp edges and/or raised material. A residual fret/damage witness is permissible. Do not remove any material in excess of 0.003(0,08) deep. Maintain general surface finish using adjacent undressed areas as a guide.

- 2) Locally inspect repair area for cracks.

Refer TSD 594 OP.210 or 213.

- 3) Mark Repair Instruction number RI B515309 or R.2A adjacent to normal 'assy of' number using the electro-chemical marking or vibro-percussion engraving techniques.

Refer Overhaul Manual
Chapter 72-09-00 Repair
Refer fig.401 for identity
marking location.

B. REPAIR BY WELDING.

- 1) Clean fretted/damaged areas and prepare for welding.

Refer TSD 594 OP.409

- 2) Degrease areas to be welded immediately prior to welding.

Refer TSD 594 OP.101

- 3) Build up fretted/damaged area by inert gas arc welding. Apply sufficient weld metal to restore diameter of tube. Group 2 weld classification.

Refer TSD 594 OP.409
Use filler rods to
OMat 366.

- 4) Hand dress weld to restore diameter. Adjacent parent material is not to be impaired. Maintain general surface finish using adjacent undressed areas as a guide.

Refer fig.401

- 5) Manipulate to remove distortion (if required).

Refer fig.401

4. REPAIR PROCEDURESUPPLEMENTARY INFORMATION4.A. PREPARATION.

- 1) Mask off bosses and holes etc. Use OMat 1/21.
with blanks leaving an aperture
open and fill oil tank with
clean Trichloroethylene
(Triklone N). Heat for 10
minutes in a vapour degreasing
tank.
- 2) Remove oil tank from degreasing
tank, drain and remove blanks.

REPAIR

79-11-01

Repair No. 3

Page 401

Jun 1/96

- 3) Vapour degrease oil tank. Refer TSD 594 OP.101
 - 4) Blow through tank with clean, dry, compressed air.
 - 5) Oven dry at $1200^{\circ}\text{C} \pm 50^{\circ}\text{C}$ for 10 minutes.
 - 6) Visually inspect internal stiffeners at sump end of tank to establish the basic position and extent of cracking.
 - 7) Mark out the relevant positions for exterior skin removal to expose the defective locations as applicable. Refer fig's.401 and 402. Note: Outer skin must be removed to effect Repair. Inner skin removal only required if inner flange(s) require replacement.
 - 8) Visually inspect to ensure that no previous identity marking(s) will be lost. If marking(s) will be lost (or obscured), record and retain for re-marking at op.4.H.9. Refer fig.401 for identity marking area.
4. B. EXTERIOR SKIN REMOVAL AND STIFFENER FLANGE DRESSING.
- 1) Cut away to remove area of skin, allowing sufficient material to dress back to marked outline(s) established at op.4.A.7. Refer fig's.401 and 402. Note: Do not impair flange material under skin section if flange is not to be replaced.
 - 2) Release skin from internal stiffener flange by grinding through spot weld nuggets and remove skin. Refer fig's.401 and 402. Note: Do not impair flange material under skin section if flange is not to be replaced.
 - 3) Trim the aperture to the outlines produced at op.4.A.7. Refer fig's.401 and 402. Repeat op.4.B.1 to 3 for each affected location.
 - 4) Remove anti-gravity ball securing flange from the removed exterior skin by grinding through attachment weld (on scrap side) around periphery of boss. Retain for refitment at op.4.G.13.

- 5) Locally fluorescent penetrant inspect exposed internal stiffener flanges. Refer TSD 594 OPS.210 or 213.
NOTE: If further internal flanges are found to be cracked, repeat operations 4.A.7. to 8 and 4.B.1. to 3.
 - 6) Dress to remove cracked flanges from the stiffeners as applicable. Refer fig's.403 and 404.
 - 7) Clean interior of tank to ensure removal of all debris produced by previous operations.
- 4.C. FABRICATION OF REPLACEMENT PARTS.
- 1) Fabricate new stiffener locating flanges. Refer fig's.410 to 413.
NOTE: Locating flanges, at each end of centre stiffener-outer skin location, are integral with closing patching supporting flanges.
 - 2) Fabricate side doubler plates for the closing patch at the outer skin location. Refer fig.412.
 - 3) Fabricate closing patches where applicable to suit contours of tank. Ensure fit of patch in relationship to aperture is of close tolerance to minimise shrinkage when welding. Refer fig.414.
 - 4) Stress relieve all new manufactured parts i.e. closing patches, stiffener locating flanges, supporting flanges, etc., at $650^{\circ}\text{C} \pm 50^{\circ}\text{C}$ for 1 hour.
 - 5) Fluorescent penetrant inspect all fabricated parts. Refer TSD 594 OPS.210 or 213.
- 4.D. STIFFENER WEB CRACK REPAIR.
- 1) Locally fluorescent penetrant inspect exposed internal stiffeners. Refer TSD 594 OPS.210 or 213.
If no cracks are present proceed to para.4.E.

| 7) | Fluorescent penetrant inspect the plug welds. | Refer TSD 594 OPS.210 or 213. |
| 8) | Clean interior of tank to ensure removal of all debris produced by previous operations. | |
| 4.F. INNER PATCH REPLACEMENT. | | |
| | <u>NOTE:</u> The following operations are required only where replacement of front, centre or rear inner stiffener flanges has been accomplished. | Repeat operations for each location affected.
Proceed to para.4.G. if not applicable. |
| 1) | Position inner skin closing patch on tank and mark where the centre of the flange corresponds in relation to the patch, remove patch. | Refer fig.406. |
| 2) | Using the position established at op.4.F.1, drill 0.125 (3,18) dia. holes spaced at 0.500 (12,70) centres through the closing patch. | Refer fig.414. |
| 3) | Position closing patch on tank and locate from three of the holes produced at op.4.F.2. i.e. middle and either end. | Refer fig.406. |
| 4) | Drill 3 off 0.125 (3,18) dia. holes through locating flange section. | Refer fig.406.
<u>NOTE:</u> These holes are used for clamping the patch during welding. |
| 5) | Clean all surfaces of inner skin closing patch, tank aperture surrounds and the stiffener flange using abrasive matt in preparation for welding. | Refer TSD 594 OP.409
Use OMat 583 |
| 6) | Degrease all surfaces of patch, tank aperture and flange areas prior to welding. | Refer TSD 594 OP.101 |

- | | | |
|-----------------------------------|--|--|
| 7) | Locate closing patch in position and secure using 3 off sheet metal clamps eg. 'Avdel'. | Ensure clean clamps are used. |
| 8) | Place tank in an enclosed argon atmosphere and plug weld closing patch to replacement flange section. | Refer TSD 594 OP.409
Use filler rod OMat 366.
Refer fig.406. |
| 9) | Remove 3 off clamps and plug weld vacated positions. | Refer TSD 594 OP.409
Use filler rod OMat 366.
Refer fig.406. |
| 10) | Inspect for fit of closing patch and manually manipulate if necessary. | |
| 11) | Locally degrease prior to welding. | Refer TSD 594 OP.101 |
| 12) | Place tank in an enclosed argon atmosphere and tack-weld the patch at equi-spaced positions around the patch to prevent distortion during welding. | Refer TSD 594 OP.409
Use filler rod OMat 366.
Refer fig.406. |
| 13) | Finally inert gas arc weld patch into position.
Weld group 2. | Refer TSD 594 OP.409
Use filler rod OMat 366.
Refer fig.406. |
| 14) | Fluorescent penetrant inspect the repair area. | Refer TSD 594 OPS.210 or 213. |
| 15) | Inspect the weld joint for acceptable weld penetration. | Refer TSD 594 OP.409 |
| 16) | Clean interior of tank to ensure removal of all debris produced by previous operations. | |
|
4.G. OUTER PATCH REPLACEMENT. | | |
| 1) | Clean all surfaces of the supporting flanges, side doubler plates and the mating areas of the oil tank using abrasive matt in preparation for welding. | Refer TSD 594 OP.409
Use OMat 583 |
| 2) | Degrease all surfaces prior to welding. | Refer TSD 594 OP.101 |

- 3) Place the supporting brackets and side doubler plates in position around the aperture at the outer skin location and clamp in position. Refer fig.407.
- 4) Resistance spot weld the supporting brackets and side doubler plates to the tank and the centre stiffener. Spot welds are to be spaced at 0.500 (12,70) centres. Refer TSD 594 OP.403
NOTE: Electrode tip to be 0.187 (4,75) dia. Refer fig's 405 and 407.
- 5) Clean the outer centre stiffener locating flange and the centre stiffener at the outer skin location using abrasive matt in preparation for welding. Refer TSD 594 OP.409
Use OMat 583
- 6) Degrease all surfaces prior to welding. Refer TSD 594 OP.101
- 7) Place the outer centre stiffener locating flange in position on the stiffener and clamp in place, adjust as necessary. Refer fig.405.
Ensure clean clamps are used.
- 8) Resistance tack weld the locating flange to the stiffener. Refer TSD 594 OP.403
Refer fig.405.
- 9) Remove clamps and check position of the locating flange by temporarily fitting the closing patch, adjust the position of the flange as necessary.
- 10) Resistance spot weld the locating flange to the stiffener. Spot welds are to be spaced at 0.500 (12,70) centres. Refer TSD 594 OP.403
NOTE: Electrode tip to be 0.187 (4,75) dia. Refer fig's.405 and 407.
- 11) Fluorescent penetrant inspect the welded joint. Refer TSD 594 OPS.210 or 213.
- 12) Place closing patch in position on tank and mark out the position of the anti-gravity ball securing flange. Remove patch. Refer fig.408.

OVERHAUL

MAIN OIL TANK - SUB-ASSEMBLY

1. General

- A. Prior to commencing assembly, refer to 72-09-00 Assembly for general assembly information.
- B. During the sub-assembly procedure, reference will be made to the Illustrated Parts Catalogue (I.P.C.) to identify those items where the nomenclature does not positively identify them, due to duplication of the title e.g. nuts, bolts, washers, bearings, gears, housings, tubes etc. When the item is a part of the breakdown of the text concerned, the item will be identified as bolt (1-10), the 1 referring to the I.P.C. Fig. No., and the 10 referring to the Item No. Where items from a different breakdown are introduced, then the breakdown number will be quoted in addition e.g. bolt (72-32-01/1-10).
- C. Throughout the text special tools are quoted by their Ref. No. e.g. (Tool 1234). For a complete list of tooling required for the assembly and for the Manufacturers Part No., refer to Special Tools, Fixtures and Equipment Table 1002.

2. Internal Cleaning of the Oil Tank

- A. Assemble Protective Blanks (Ref.Fig.501).
- (1) Screw the threaded protector (Tool 681) into the overflow drain/oil sampling plug location and tighten.
 - (2) Screw the threaded protector (Tool 918) into the drain plug location and tighten.
 - (3) Assemble protectors to the remaining locations as listed in Table 501.

NOTE: Protective blank retaining bolts should be hand-tight only.

Table 501

B. Prepare the Mobile Cleaning Tank.

NOTE: A cleaning tank, similar to the one described and illustrated (Tool 898) (Ref.Fig.502), may be used providing it incorporates the following. A reservoir capable of holding a minimum of two gallons (Imp.) (9,09 L) and a drain tray incorporating a removable filter paper.

- (1) Thoroughly clean the tray of the cleaning tank, then assemble a new paper filter, Whatman N.117, 27 cm diameter, to the holder and secure it with the retaining ring.
- (2) Install the filter assembly into the drain location of the cleaning tank.

C. Assemble the Oil Tank to the Cleaning Fixture (Ref.Fig.503).

- (1) Unscrew the two swing bolt hand nuts on the cleaning fixture (Tool 899), then raise the two hinged latches.
- (2) Slide the oil tank into the cleaning fixture, reposition the latches and tighten the hand nuts.

D. Cleaning Procedure.

- (1) Using lifting equipment raise the cleaning fixture/tank and suspend it over the cleaning tank tray.
- (2) If necessary, loosen the two cap head bolts and adjust the position of the fixture lifting ring so that the cleaning fixture is level.

- (3) Remove the protector (Tool 917) from the contents transmitter location and pump approx. two gallons of white spirit into the oil tank.
- (4) Replace the protector and agitate the oil tank, tilting it as far as possible to ensure thorough cleaning of the tank interior.
- (5) Lower the oil tank to approx. six inches above the tray of the cleaning tank, then remove the protector from the vent valve location on the underside of the tank. Allow the oil tank to drain completely, then re-assemble the protector.
- (6) Carefully remove the filter assembly from the cleaning tank and inspect the filter for impurities.
- (7) If any impurities are present, renew the filter paper and repeat the cleaning process. Continue the cleaning process until the filter paper is found to be clean.
- (8) After satisfactory cleaning thoroughly dry the interior of the tank with clean dry air.

E. Remove the Oil Tank from the Cleaning Fixture.

- (1) Position the oil tank and cleaning fixture on the bench, unscrew the two swing bolt hand-nuts, raise the hinged latches and slide the oil tank out of the cleaning fixture.
- (2) Ensure the stencilled markings on the tank are complete (Ref. SB.79-8433-8), then place the tank into the container (Tool 84).

3. Assemble the Vent Valve and Filter Unit

A. Assemble the Housing to the Filter Cover.

NOTE: This procedure is only applicable if it has been found necessary to dismantle the filter unit during disassembly.

- (1) Secure the holder (Tool 970) in the vertical position to a Hydraclamp.
- (2) Assemble the cover (1-130), with the housing location on the horizontal centre line and to the left, to the holder and secure with four nuts and washers.

- (3) Assemble the gasket (1-230) and housing (1-200), with the vent valve location facing upward, to the cover.
- (4) Apply lubricant 'A' to the six retaining bolts (1-210), screw them, from the inside of the cover, into the housing. Ensure the bolts have a minimum locking (run-down) torque of 3.5 lbf in. (0,4 N.m) torque-tighten between 67 and 73 lbf in. (7,6 and 8,2 N.m).
- (5) Remove the cover assembly from the holder and the holder from the Hydraclamp.

B. Pressure Test the Cover and Housing Assembly.

NOTE: This procedure is only applicable if the procedure in para.3.A. has been carried out.

- (1) Assemble the cover/housing to the blanking fixture.
 - (a) Withdraw the locking pin from the bleed valve retaining plate of the pressure test blanking fixture (Tool 983), then swing the bleed valve away from the fixture (Ref.Fig.504).
 - (b) Offer the cover assembly to the fixture with the housing positioned over the inlet union of the fixture. Ensure the outlet of the housing is in line with the bleed valve, then secure the cover with nuts and washers.
 - (c) Assemble the sealing ring (1-120) to the groove of the housing outlet.
 - (d) Unscrew the knurled locking nut on the bleed valve, allowing the valve to slide in the retaining plate. Swing the retaining plate to the vertical and insert the locking pin. Slide the bleed valve forward over the sealing ring and secure by tightening the locking nut against the retaining plate.

NOTE: The position of the bleed valve can be adjusted, if necessary, by unscrewing the grub screw in the stop ring and screwing the stop ring in or out.

(2) Pressure test procedure.

The pressure test is carried out with oil, lubricant A, at a temperature of 120 ± 5 deg C and pressure of 6 psig (41,5 kPA). Alternative equipment to that described and illustrated (Tool 583) (Ref.Fig.505) may be used.

WARNING: PROTECTIVE CLOTHING MUST BE WORN AND
ENSURE ADEQUATE ROOM VENTILATION.

- (a) Place the cover and fixture assembly in the drain tray of the pressure test rig and couple the rig oil pressure pipe to the inlet union on the fixture.
- (b) Check that the rig contains the required amount of oil, shown by the dipstick.
- (c) Connect the test rig to the mains power supply, switch ON the heater and allow the oil temperature to reach 120 ± 5 deg C.

WARNING: ENSURE THAT THE BLEED VALVE NIPPLE
IS POINTING DOWNWARDS AND THAT THE
HOT OIL DOES NOT SPLASH.

- (d) Open the bleed valve on the fixture, then switch ON the rig oil circulating pump to flow oil through the fixture and out of the bleed valve.
- (e) Allow the oil to flow until the temperature stabilises at 120 ± 5 deg C. (approx. 10 min), then close the bleed valve.
- (f) Increase the oil pressure from the test rig to 6 psig (41,5 kPA) and maintain this pressure for at least 15 min checking continuously for leakage from the cover to housing joint. No leakage is permissible.
- (g) Switch OFF the circulating pump and oil heater then disconnect the test rig from the electrical supply. Allow the assembly to cool then open the bleed valve to relieve the oil pressure.

MK.610-14-28
OVERHAUL

- (3) Remove the pressure test equipment.
- (a) Uncouple the oil pressure pipe from the union of the fixture.
 - (b) Unscrew the bleed valve locknut and withdraw the bleed valve over the seal on the housing outlet.
 - (c) Withdraw the locking pin from the retaining plate and swing the retaining plate to the horizontal position.
 - (d) Unscrew and remove the nuts and washers securing the cover assembly and remove the cover from the fixture.
 - (e) Remove the sealing ring from the housing outlet and place it in a suitable container. Wipe off all oil from the cover assembly with a clean rag.
- (4) Rectification of leakage from the joint face.
- (a) Secure the holder (Tool 970) in the vertical position to a Hydraclamp.
 - (b) Assemble the cover, with the vent valve connection to the left and facing upward, to the holder and secure with four nuts and washers.
 - (c) Remove the six bolts securing the housing to the cover and remove the housing.
 - (d) Inspect the gasket and, if faulty, replace with a new item. If the gasket is found to be acceptable carry out a blueing check on the faces of the cover and housing and remove any high spots.
 - (e) Apply lubricant 'A' to the six retaining bolts and screw them from the inside of the cover into the housing. Ensure the bolts have a minimum locking (run-down) torque of 3.5 lbf in. (0,4 N.m) torque-tighten between 67 and 73 lbf in. (7,6 and 8,2 N.m).
 - (f) Remove the cover assembly from the holding plate and the holder from the Hydraclamp.

SUB-ASSEMBLY

79-11-01

Page 511

Jun 1/76

OLYMPUS 593
MK.610-14-28
OVERHAUL

- (g) Repeat the pressure test (Ref. para.3B) until a satisfactory result has been obtained.

NOTE: Do not separate the housing from the cover after a satisfactory pressure test.

C. Assemble the Filter Pack (Pre SB.79-9 only) (Ref.Fig.506).

NOTE: If the filter and deflector are assembled to the cover assembly, this procedure is not applicable, but the clearance between the deflector and filter must be as quoted in para.(6). If the items are disassembled, assemble the original items as detailed para.(1),(2),(6) and (7), or new items as detailed in para.(1) and (3) to (7).

- (1) Insert the filter (1-190), with the largest outside diameter entering first, into the cover assembly and press fully home.
- (2) Assemble the deflector cover (1-170) to the cover assembly and align the rivet holes in both items.
- (3) Assemble the protector (Tool 581) to the inside of the deflector cover (1-170) with the rubber face of the protector abutting the deflector.
- (4) Assemble the deflector cover and protector into the cover assembly so that the rim of the deflector abuts the filter pack. Ensure that the scallop lines up with the scallop in the rim of the cover assembly.
- (5) Using the holes in the cover as a guide, drill three holes 0.1331/0.1299 in. (3,378/3,277 mm) in the deflector. Remove the protector then reassemble the deflector to the cover assembly.
- (6) Insert the three rivets (1-180) to locate the deflector within the cover. Apply finger pressure to the filter to dish the filter gauze toward the cover. Ensure that the distance from the centre of the filter to the deflector is within 0.625 in. (15,87 mm) minimum and 0.875 in. (22,22 mm) maximum.
- (7) Secure the deflector to the cover, and check that the filter has maintained its concave shape and clearance from the deflector,

D. Assemble the Vent Valve.

- (1) Determine the adjusting plate thickness. (Ref. Fig.507).
 - (a) Insert the valve (1-60) into the vent valve housing (1-70) (Ref.Fig.506), then measure the depth from the joint face of the housing to the top of the valve and record as dimension A.
 - (b) Measure the thickness of the mounting bracket (1-50) and record as dimension B.

OVERHAUL

- (c) Measure the free length of the bellows unit, from the mating side of the flange. Subtract from this dimension, dimension A + B + 0.030 in. (0,762 mm), the 0.030 in. representing the combined thickness of the sealing washers (1-30).
- (d) Machine the adjusting plate (1-40) to the required thickness (Ref.72-09-21 Repair Fig.453).
- (2) Assemble the vent valve. (Ref.Fig.506).
 - (a) To the mounting face of the vent valve housing assemble the mounting bracket, adjusting plate and bellows unit, interpose a sealing washer between each item.
 - (b) Apply lubricant 'B' to the four retaining bolts (1-10) and screw the bolts into the housing. Ensure the bolts have a minimum locking (run-down) torque of 2 lbf in. (0,23 N.m) torque-tighten between 36 and 40 lbf in. (4,1 and 4,5 N.m), wire-lock the bolts in pairs.
 - (c) Assemble the sealing ring (1-120) to the cover assembly, then slide the vent valve housing over the seal.
- 4. Assemble the Mounting Brackets to the Oil Tank (Ref.Fig.508)
 - A. Assemble the Rear Upper Bracket.
 - (1) If a new bracket (2-120) is to be assembled, first assemble a pin (2-110) and retaining ring (2-100) to the bracket.
 - (a) Assemble the retaining ring to the pin groove then place the pin into an approved freezing agent (Cardice) for approximately 20 minutes.
 - (b) Using protective gloves remove the pin from the freezing agent then press the pin into its location in the bracket, from the counterbored side of the hole.
 - (2) Apply lubricant 'B' to the two retaining bolts (2-90). Offer the bracket, at 90 degrees to the oil return flange face with the dowel pointing away from the tank.

- (3) Interpose the spacer (2/95) between bracket and flange then assemble the bolts from the flange side and secure with self-locking nuts (2-80). Ensure the nuts have a minimum locking (run-down) torque of 3.5 lbf in. (0,4 N.m) torque-tighten between 85 and 95 lbf in. (9,6 and 10,7 N.m).
- (4) Assemble the protector (Tool 1044) to the oil return flange.

B. Assemble the Rear Lower Bracket.

- (1) Remove the protector from the oil feed flange, then offer the rear lower mounting bracket (2-230) to the mating face of the flange with the 'D' head bolt locations facing away from the tank.
- (2) Apply lubricant B to the two 'D' headed bolts (2-200) and the two plain bolts (2-220), then install the 'D' headed bolts in the outer holes of the bracket and the plain bolts in the inner holes.
- (3) Assemble the self-locking nuts (2-190) and (2-210) to the bolts. Using the cranked wrench (Tool 1555), ensure the nuts have a minimum locking (run-down) torque of 3.5 lbf in. (0,4 N.m) torque-tighten between 85 and 95 lbf in. (9,6 and 10,7 N.m).
- (4) Assemble the protector (Tool 1045) to the oil feed flange and secure with the three captive bolts.

C. Assemble the Front Lower Link.

- (1) Assemble the front lower link (2-60) to the mounting lug with the larger diameter hole to the lug, chamfer outwards. Insert the hollow pin (2-50) through the link into the mounting lug.
- (2) Apply lubricant 'B' to the retaining bolt (2-40), then pass the bolt through the hollow pin and screw into the mounting lug.

NOTE: This bolt will be torque-tightened on assembly to the engine and should be hand tight at this stage.

5. Prepare the Oil Tank for Assembly of Items/Components

A. Assemble the Oil Tank to the Stand (Ref.Fig.509).

NOTE: The stand (Tool 482) for the oil tank is a combined build and pressure test stand. The cradle (Tool 484), which is attached to two support pillars of the stand, will pivot from a horizontal to a vertical position and is secured by a locking pin. An oil tank support frame (Tool 673) is attached to the cradle and secured by four retaining hooks.

- (1) Place the oil tank on the bench with its mounting brackets uppermost.
- (2) Rotate the cradle to the vertical position, insert the locking pin. Unscrew the four hand nuts, to release the retaining hooks securing the support frame to the cradle.
- (3) Lift the support frame out of the cradle and offer the frame to the mounting brackets of the oil tank.
- (4) Secure the frame to the oil tank with a slave nut and bolt at the front and rear lower brackets and two slave bolts at the rear upper bracket.
- (5) Lift the oil tank and support frame, then, with the base (larger end) of the oil tank downwards, locate the support frame over the four retaining hooks on the cradle and tighten the hand nuts.

6. Assemble the Components to the Oil Tank

A. Assemble the Overflow Drain and Oil Sampling Plug SB.79-6 (Ref.Fig.510).

- (1) Unscrew and remove the protector from the overflow drain location.

- (2) Apply lubricant 'A' to the threads of the overflow drain coupling plug (79-11-03/1-25).
- (3) Assemble the corrugated seal (79-11-03/1-30) to the plug then screw the plug into its location and torque-tighten to 390 lbf in. (44,0 N.m). Wire-lock the plug to the tank.
- (4) Apply lubricant 'A' to the threads of the oil sampling plug (79-11-03/1-15).
- (5) Assemble the sealing washer (79-11-03/1-17) to the plug and screw the plug into the overflow drain coupling plug. Torque-tighten to 110 lbf in. (12,0 N.m).

B. Assemble the Filler/Drain Coupling to the Oil Tank
(Ref.Fig.510).

- (1) Assemble the pressure cap (79-11-02/1-10) to the filler/drain coupling (79-11-02/1-60) by turning the outer locking sleeve on the cap counter-clockwise and pulling it back to locate the two pegs into the slots in the sleeve. Press the cap over the coupling and ensure the sleeve returns to the locked position.
- (2) Remove the protector from the filler/drain flange on the oil tank. Assemble the gasket (79-11-02/1-70) and filler/drain coupling to the flange.
- (3) Apply lubricant 'B' to the shorter retaining bolt (79-11-02/1-50) then assemble a wire-locking washer (79-11-03/1-40) to the bolt. Screw the bolt through the coupling and gasket into the flange at the hole furthest from the tank.

- (4) Apply lubricant 'B' to the four bolts (79-11-02/1-20). Assemble the two brackets (79-11-02/1-30 and 40) to the filler/drain coupling flange at the remaining bolt positions (Ref.Fig.510). Assemble the four bolts with the oil sampling plug or filler/drain coupling pressure cap retaining wire tag under the heads of two of the bolts.
- (5) Ensure the five bolts have a minimum locking (run-down) torque of 3.5 lbf in. (0,4 N.m) torque-tighten between 67 and 73 lbf in. (7,6 and 8,2 N.m).
- (6) Wire-lock the oil sampling plug to the wire-locking washer.

C. Assemble the Drain Plug to the Oil Tank (Ref.Fig.510).

- (1) Remove the screwed protector from the drain plug location at the base of the oil tank.
- (2) Apply lubricant 'B' to the threads of the drain plug (1-350). Assemble the corrjoint seal (1-360) to the plug then screw the plug into the tank. Torque-tighten between 230 and 250 lbf in. (26,0 and 28,2 N.m).

D. Assemble the Contents Transmitter to the Oil Tank (Ref. Fig.510).

- (1) Remove the protector from the contents transmitter location on the oil tank.
- (2) On engines pre-SB.79-2 carefully insert the contents transmitter (79-31-01/1-10) into its location with the electrical connection downwards.

NOTE: The required position of the transmitter is fixed by an offset bolt-hole.

- (3) Apply lubricant 'B' to the eleven retaining bolts (79-31-01/1-20, 25 and 30), then assemble the bracket (79-31-01/1-100) to the flange of the transmitter as shown (Ref.Fig.510).
- (4) Screw in two bolts (73-31-01/1-25) to secure the transmitter and bracket, then the remaining nine bolts to secure the transmitter.

NOTE: The retaining bolt with the lockwire hole should be positioned nearest to the drain plug.

- (5) On engines embodying SB.79-2 assemble the gasket (79-31-01/1-110) to the contents transmitter flange, then carefully insert the contents transmitter into the tank, with the electrical connection downwards.
 - (6) Assemble the bracket (79-31-01/1-100) to the transmitter flange as shown (Ref.Fig.510). Apply lubricant 'B' to the retaining bolts (79-31-01/1-20B), screw them into the tank to secure the transmitter and bracket.
 - (7) Torque-tighten the bolts between 85 and 95 lbf in. (9,6 and 10,7 N.m), then wire-lock the securing bolts together.
- E. Assemble the Negative 'G' Ball Valve to the Oil Tank (Ref.Fig.511).
- (1) Remove the protector from the negative 'G' ball valve location, then carefully lower the ball (1-280) into the oil tank.
 - (2) Support the top (smaller end) of the oil tank and withdraw the stand locking pin, lowering the top of the oil tank until the ball rolls into its upper location.
 - (3) Assemble the gasket (1-270) to the cover (1-250), then assemble cover/gasket to the tank, the longest side of the tube towards the ball.
 - (4) Apply lubricant 'B' to the eight retaining bolts (1-260), then screw the bolts through the cover into the tank.
 - (5) Return the stand to the horizontal position and insert the locking pin.
 - (6) Ensure the cover securing bolts have a minimum locking (run-down) torque of 3.5 lbf in. (0,4 N.m) torque-tighten between 85 and 95 lbf in. (9,6 and 10,7 N.m).
- F. Assemble the Filter to the Oil Tank (Ref.Fig.511).
- (1) Remove the protector from the oil feed flange of the oil tank. Insert the filter (1-340), with the spring outwards, into the oil tank.

- (2) Assemble the spring retainer (1-330) so that the filter spring is located in the boss of the retainer.
- (3) Apply pressure to the retainer, to compress the spring, until the retaining ring groove is visible. Maintain the pressure and assemble the retaining ring (1-320).
- (4) Re-assemble the protector to the flange.

G. Assemble the Inspection Cover to the Oil Tank (Ref.Fig.511).

- (1) Remove the protector from the inspection cover flange on the side of the oil tank.
- (2) Assemble the gasket (1-310) and cover (1-300) to the flange. Apply lubricant B to the bolts (1-290), screw the bolts into the flange to retain the cover. Ensure the bolts have a minimum locking (run-down) torque of 3.5 lbf in. (0,4 N.m) torque-tighten between 67 and 73 lbf in. (7,6 and 8,2 N.m).

H. Assemble the Vent Valve and Filter Cover to the Oil Tank (Ref.Fig.512).

- (1) Remove the protector from the vent valve and filter location, then assemble the gasket (1-240), cover and vent valve unit to the oil tank.
- (2) Apply lubricant 'B' to the 18 cover retaining bolts (1-140), then screw the bolts into all the bolt locations except the two vent valve bracket retaining bolt-holes. Ensure the bolts have a minimum locking (run-down) torque of 3.5 lbf in. (0,4 N.m) torque-tighten between 67 and 73 lbf in. (7,6 and 8,2 N.m).

NOTE: It will be necessary to temporarily remove the vent valve from the cover in order to assemble and torque-tighten the two bolts positioned beneath the bracket.

- (3) Apply lubricant 'B' to the plain bolt (1-150) and double hexagon bolt (1-160), then screw the bolts into the tank to secure the vent valve mounting bracket. Ensure both bolts have a minimum locking (run-down) torque of 3.5 lbf in. (0,4 N.m) then torque-tighten the plain bolt between 67 and 73 lbf in. (7,6 and 8,2 N.m) and the double hexagon bolt between 85 and 95 lbf in. (9,6 and 10,7 N.m).

NOTE: The double hexagon bolt has been provided to allow clearance between the bolt head and the vent valve housing when using a socket type wrench.

7. Pressure Test the Oil Tank

NOTE: This pressure test must be carried out if any of the joint faces have been disturbed.

A. Assemble the Pressure Test Adapters to the Oil Tank (Ref.Fig.513).

- (1) Remove the protector from the oil return flange and assemble the oil inlet adapter (Tool 675). Screw the six retaining bolts through the adapter and flange into the clamp pad of the adapter.
- (2) Remove the protector from the oil feed flange and assemble the oil outlet adapter (Tool 674) with the scallops of the adapter matching those of the rear lower mounting bracket, screw in and tighten the three retaining bolts.
- (3) Insert the bleed valve fixture (Tool 984) into the breather location of the vent valve and secure the retaining plate with two bolts.
- (4) Attach approx. 5 ft (1524,0 mm) of 0.187 in. (4,75 mm) bore clear polythene pipe to the bleed valve nipple and position the free end of the pipe in the oil tray under the oil tank.

B. Assemble the Pressure Test Equipment (Ref.Fig.514). Alternative equipment to that described and illustrated (Tool 583) (Ref.Fig.505) and (Tool 554) (Ref.Fig.509) may be used.

- (1) Couple the oil delivery pipe from the test rig to the regulating valve.
- (2) Couple the oil return pipe from the test rig to the quick release coupling of the oil outlet adapter on the oil tank.
- (3) Couple the oil delivery pipe (Tool 659) (part of Tool 482) from the regulating valve to the inlet adapter on the oil tank.
- (4) Couple the oil relief pipe (Tool 660) (part of Tool 482) from the regulating valve to the supply rig.
- (5) Connect an air supply pipe to the air inlet connection of the regulating valve.
- (6) Position two sets of screens (Tool 829) around the stand.

C. Pressure Test Procedure.

WARNING: PROTECTIVE CLOTHING MUST BE WORN AND ENSURE ADEQUATE ROOM VENTILATION.

- (1) The pressure test is carried out with oil, lubricant 'A', at a temperature of 120 ± 5 deg C and pressure of 6 psig (41,5 kPA).
- (2) Withdraw the locking pin and rotate the oil tank to the vertical position, replace the locking pin.
- (3) Check that the pressure test rig (Tool 583) contains the correct amount of oil, shown by the dipstick.
- (4) Connect the rig to the mains power supply, switch ON the heater and allow the oil temperature to reach 120 ± 5 deg C.
- (5) Open the bleed valve (Tool 984) at the tank vent valve breather location and close the drain valve at the tank outlet adapter.
- (6) Open the pressure test rig delivery and return stop valves and drain valve.
- (7) Turn on the air supply and operate the regulating valve control to provide only sufficient oil pressure to fill the tank then switch on the test rig oil circulating pump.
- (8) Allow the tank to vent thoroughly, via the bleed valve, then close the valve and open the tank drain valve allowing oil to flow through the tank until the temperature stabilises at 120 ± 5 deg C (20 min approx.).
- (9) Close the drain valve and open the bleed valve to ensure no air remains in the tank.
- (10) Close the bleed valve then operate the regulating valve control to slowly increase the oil pressure to 6 psig. Maintain the pressure to tank for 15 min checking continuously for leaks from all tank joint faces, no leakage is permissible.

CAUTION: ENSURE THAT AS THE PRESSURE IS INCREASED THE REGULATING VALVE IS SEEN TO BE OPERATING AND DOES NOT EXCEED THE 6 PSIG TEST LIMIT.

IN48046

SUB-ASSEMBLY

79-11-01

Page 530

MK.610-14-28
OVERHAUL

- (11) On completion of a satisfactory test or in the event of a leak, switch off the test rig circulating pump and open the tank return stop valve and bleed valve. Allow the oil in the tank to drain back to the test rig.
- (12) Switch OFF the electrical supply to the test rig and the air supply to the regulating valve.

D. Rectification of Leakage.

- (1) Check the torque loading of the component securing bolts.
- (2) Remove the component, from which the leakage was observed, from the oil tank. Examine the oil tank and component mating faces. Rectify any defects then reassemble the component to the tank using a new gasket or sealing ring. Torque-tighten the component securing bolts in accordance with the relevant portion of this chapter.
- (3) Repeat the pressure test procedure (Ref. para. 7.C.) until a satisfactory result is obtained.

E. Remove the Pressure Test Equipment.

NOTE: Wherever a pipe is uncoupled a quantity of trapped oil will drain, therefore ensure that before disconnecting, a suitable container is positioned beneath the coupling. Return all clean, drained oil to the pressure test rig.

- (1) Uncouple the quick release coupling of the return pipe from the outlet adapter, open the drain valve and drain the oil tank contents.
- (2) Completely drain the oil tank by removing the drain plug. Replace the drain plug with the seal and torque-tighten between 230 and 250 lbf in. (26,0 and 28,2 N.m).
- (3) Uncouple the oil delivery pipe from the regulating valve, then remove the pipe from the union of the inlet adapter on the oil tank.
- (4) Uncouple the oil relief pipe from the regulating valve, then remove the pipe from the union on the pressure test rig.

SUB-ASSEMBLY

79-11-01

Page 531

Jun 1/76

OLYMPUS 593

MK.610-14-28
OVERHAUL

- (5) Uncouple the test rig oil delivery pipe from its union at the regulating valve.
- (6) Unscrew the retaining bolts and remove the inlet and outlet adapters from the oil tank.
- (7) Assemble the protector (Tool 1044) to the oil return flange, then assemble the protector (Tool 1045) to the oil feed flange.
- (8) Unscrew the bolts securing the bleed valve retaining plate and withdraw the valve. Assemble the protector (Tool 664) to the vent valve breather location.

8. Remove the Oil Tank from the Stand and Prepare for Installation

A. Remove the Oil Tank from the Stand.

- (1) Unscrew the four hand nuts which secure the support frame to the cradle.
- (2) Lift the support frame and oil tank from the cradle and carefully place them on the bench with the support frame uppermost.
- (3) Remove the nuts and bolts securing the support frame to the oil tank mounting brackets, then remove the support frame.

B. Wire-lock the Drain Plug and Overflow Drain Valve (Ref. Fig.510).

- (1) Wire-lock the drain plug to the nearest bolt on the contents transmitter flange.
- (2) Wire-lock the overflow drain valve to the filler/drain coupling flange.

C. Prepare the Oil Tank for Installation.

- (1) Wipe all oil from the oil tank exterior with a clean cloth and cleaning agent.
- (2) Place the oil tank into its container (Tool 84).

NOTE: The oil tank is now complete and can be despatched for assembly to the engine.

NOTE: All protectors except those attached to the oil feed and return flanges (Tools 1044 and 1045) should be returned to the disassembly area.

OVERHAULMAIN OIL TANK - SPECIAL TOOLS, FIXTURES AND EQUIPMENT1. General

- A. The special tools, fixtures and equipment listed in Table 1001 and 1002 are those required to disassemble and assemble/test the main oil tank.
- B. The tools have been listed in order of usage, and the Tool Ref.No. is the number quoted in the text. Tools marked with an * are used in more than one aspect of overhaul and will be duplicated in the tables.
- C. The tools are not illustrated in the manual except in operation (as required) in the appropriate section. For identification and leading particulars of the tools, refer to the Illustrated Tools and Equipment Manual.

2. Main Oil Tank Disassembly Tools

TOOL REF.NO.	MANUFACTURER PART NO.	DESCRIPTION
* 482	P3C.1086838	Stand, oil tank
* 673	P3C.1089232	Support frame part of 482
* 918	P3C.1223103	Protector, drain plug location
* 919	P3C.1223104	Protector, negative 'G' ball valve location
* 677	P3C.1089237	Protector, vent valve filter location
* 678	P3C.1089238	Protector, inspection cover location
* 680	P3C.1089240	Protector, filler/drain coupling location
* 681	P3C.1089241	Protector, overflow drain/oil sampling plug location
* 917	P3C.1223100	Protector, contents transmitter
* 676	P3C.1089236	Protector, oil feed flange
* 916	P3C.1223098	Protector, oil return flange

FILL DRAIN CONNECTION - CLEANING

1. General

- A. Prior to commencing the cleaning refer to 72-09-00 Cleaning for details of the cleaning processes referred to in Table 201.
- B. To ensure that all items within this breakdown that require cleaning and subsequent Inspection/Check are recognized, and identified by their Part Number, figures are provided which equate with the Illustrated Parts Catalogue (I.P.C.). Thus, Fig.201 Item 10 equates with the relevant Figure and Item Number in the same breakdown in the I.P.C. Items illustrated in the I.P.C. which are not illustrated in this breakdown, are those items which are either discarded at overhaul, or are normally assembled to another item and are only called up by number.
- C. As all items requiring cleaning are illustrated in the figures, Table 201 does not list all items, but deals collectively with the items requiring the same cleaning process.
- D. On receipt of the items from disassembly, all protective blanks, covers etc. deemed necessary for the protection of the items will have been assembled and, in addition, many of the items will arrive in containers. Any special containers, blanks, covers etc. are listed in Table 202 by their Tool Ref. No. (Tool 123). For the manufacturer's Part No. refer to the appropriate Table in Special Tools, Fixtures and Equipment Section.

2. Cleaning Components

- A. All blanks, covers etc. must be removed from the items prior to cleaning and reassembled immediately afterwards. Items received in special cleaning containers should remain therein during the cleaning procedures unless otherwise stated.
- B. All items contained in this breakdown must be cleaned by the appropriate processes quoted in the table, to achieve a cleanliness to enable the Inspection/Check to be carried out correctly. Where alternative processes are quoted, the operator must decide what process to use depending on the amount of contamination of the item. Any item that is not cleaned satisfactorily must be recleaned by the appropriate process.

MK.610-14-28
OVERHAUL

- C. When an assembly item has attached parts that have certain protective finishes e.g. silver plating, the cleaning process for the assembly item may damage the finish of the part. To minimize the effect on the finish of the part, reduce the process immersion time to a minimum. If the finish is damaged, then the damaged finish will have to be replaced or reconditioned.

OVERFLOW DRAIN COUPLING - CLEANING

1. General

- A. Prior to commencing the cleaning refer to 72-09-00 Cleaning for details of the cleaning processes referred to in Table 201.
- B. To ensure that all items within this breakdown that require cleaning and subsequent Inspection/Check are recognized, and identified by their Part Number, figures are provided which equate with the Illustrated Parts Catalogue (I.P.C.). Thus, Fig.201 Item 10 equates with the relevant Figure and Item Number in the same breakdown in the I.P.C. Items illustrated in the I.P.C. which are not illustrated in this breakdown, are those items which are either discarded at overhaul, or are normally assembled to another item and are only called up by number.
- C. As all items requiring cleaning are illustrated in the figures, Table 201 does not list all items, but deals collectively with the items requiring the same cleaning process.
- D. On receipt of the items from disassembly, all protective blanks, covers etc. deemed necessary for the protection of the items will have been assembled and, in addition, many of the items will arrive in containers. Any special containers, blanks, covers etc. are listed in Table 202 by their Tool Ref. No. (Tool 123). For the manufacturer's Part No. refer to the appropriate Table in Special Tools, Fixtures and Equipment Section.

2. Cleaning Components

- A. All blanks, covers etc. must be removed from the items prior to cleaning and reassembled immediately afterwards. Items received in special cleaning containers should remain therein during the cleaning procedures unless otherwise stated.
- B. All items contained in this breakdown must be cleaned by the appropriate processes quoted in the table, to achieve a cleanliness to enable the Inspection/Check to be carried out correctly. Where alternative processes are quoted, the operator must decide what process to use depending on the amount of contamination of the item. Any item that is not cleaned satisfactorily must be recleaned by the appropriate process.

OIL SYSTEM DISTRIBUTION - INSPECTION/CHECK

1. General

- A. Each item in this chapter is given a two-part identification; thus, 302-20 refers to Figure 302 and to Item 20 called out on that figure. Each item may be further identified by its Part Number by the use of Table 303, which cross-refers figures in this chapter to the equivalent chapter and figure in the Illustrated Parts Catalogue (I.P.C.); the called-out item number will be the same on both figures.
- B. All items which will be crack tested are listed in Tables 301 and 302.
- C. Dimensional checks are cross referenced to the equivalent Fits and Clearances Schedule (F.C.S.) chapter against the item concerned.
- D. When the inspection of an item discloses a minor defect that requires rectification, it is defined as 'Accept after repair'. On all such occasions the item must be rectified in accordance with Standard Practices 72-09-22 Repair. Where a Ref.No. follows 'Accept after repair' e.g. (Ref.72-21-01 Repair No.1), a specific Repair Scheme is available to which the item must be rectified. Items that are rejected, or for which a repair scheme is not currently available, should be held at the discretion of the operator, as service experience may prove the need for a repair.
- E. On completion of a repair, rectification or test, the item(s) must be inspected, to ensure that the necessary work has been satisfactorily completed.

2. General Inspection

- A. Inspect all items illustrated in this chapter, whether specified or not, in accordance with Standard Practices (Ref.72-09-00 Inspection/Check). In addition, carry out the inspections detailed for the specified items, from para.4 onwards.
- B. Inspection terms used in this chapter are explained in Standard Practices (Ref.72-09-00 Inspection/Check).

3. Crack Detection

- A. Magnetic Particle Crack Detection.

(1) Submit the items listed in Table 301 to crack detection in accordance with the process quoted.

4. Fuel Cooled Oil Cooler (302-10)

A. Inspect in Accordance with the Vendors Overhaul Manual
(Ref.79-21-03).

5. Flanged Pins (302-40, 80 and 120)

A. Inspect Pins.

(1) Nicks and burrs.

Accept, if repair
preserves profile
for location.

6. Link (302-250)

A. Inspect Link.

(1) Distortion or cracks.

Reject.

(2) Nicks and burrs.

(a) At bolt bore and bolt
trap face, or less than
0.010 in. (0,250 mm) deep
at flanged pin location
bore.

Accept, if repair
retains profile
and surface
flatness.

INSPECTION/CHECK

79-20-00

7. Tubes (303-10/80, 304-10/190, 305-10/250, 306-150, 307-80/180, 308-80, 309-230/240 and 310-150/330)

A. Inspect all Tubes and Threaded Components (Ref.72-09-00 Inspection/Check).

B. Inspect all Flanged End Gasket Abutment Faces.

(1) Scores.

(a) Less than 0.030 in.
(0,760 mm) deep, but
not extending more
than half-way across
face.

Accept, if repair
preserves surface
flatness and
sealing capability
and is within 5
per cent reduction
of flange thick-
ness.

(2) Nicks and burrs.

Accept, if repair
preserves surface
flatness and
sealing capability
and is within 5
per cent of flange
thickness.

(3) Wear and fretting.

(a) Flange thickness reduced
more than 5 per cent.

Reject.

(b) Bolt holes elongated not
more than 0.030 in.
(0,760 mm).

Accept after
repair.

C. Inspect Gasket Abutment Face at Thermometer Flange on
303-80.

(1) Apply inspection standards as detailed in para.B.

D. Inspect Drain Valve Metallic Seal Abutment Face on 304-10.

(1) Apply inspection standards as detailed in para.B.

INSPECTION/CHECK

79-20-00

Page 305

8. Brackets (302-220, 303-55/110, 304-270 and 310-180)

A. Inspect Brackets.

- (1) Distortion. Accept, if repair preserves shape without cracking.
- (2) Wear and fretting.
 - (a) Bolt holes elongated not more than 0.030 in. (0,760 mm). Accept after repair.
- (3) Nicks and burrs. Accept after repair.

9. Magnetic Screwed Plug (311-40)

A. Inspect Thread (Ref.72-09-00 Inspection/Check).

B. Inspect Magnet.

- (1) Magnet damage, or insecure. Reject.

C. Check Magnetic Capability.

- (1) Clean the magnet thoroughly, using trichloroethane (Ref.); dry off thoroughly. Similarly treat three steel balls of 0.5 in. (12,7 mm) diameter.
- (2) Check that the magnet will lift and support the three balls.
 - (a) Magnet will not support load. Reject.
 - (b) Magnet will support load. Accept.
- (3) Fit a protective cover to the magnet and store the plug in a transit case.

10. Drain Valve and Body Assembly (311-50)

A. Inspect Threads (Ref.72-09-00 Inspection/Check).

OIL COOLER - CLEANING

1. General

- A. Prior to commencing the cleaning refer to 72-09-00 Cleaning for details of the cleaning processes referred to in Table 201.
- B. To ensure that all items within this breakdown that require cleaning and subsequent Inspection/Check are recognized, and identified by their Part Number, figures are provided which equate with the Illustrated Parts Catalogue (I.P.C.). Thus, Fig.201 Item 10 equates with the relevant Figure and Item Number in the same breakdown in the I.P.C. Items illustrated in the I.P.C. which are not illustrated in this breakdown, are those items which are either discarded at overhaul, or are normally assembled to another item and are only called up by number.
- C. As all items requiring cleaning are illustrated in the figures, Table 201 does not list all items, but deals collectively with the items requiring the same cleaning process.
- D. On receipt of the items from disassembly, all protective blanks, covers etc. deemed necessary for the protection of the items will have been assembled and, in addition, many of the items will arrive in containers. Any special containers, blanks, covers etc. are listed in Table 202 by their Tool Ref. No. (Tool 123). For the manufacturer's Part No. refer to the appropriate Table in Special Tools, Fixtures and Equipment Section.

2. Cleaning Components

- A. All blanks, covers etc. must be removed from the items prior to cleaning and reassembled immediately afterwards. Items received in special cleaning containers should remain therein during the cleaning procedures unless otherwise stated.
- B. All items contained in this breakdown must be cleaned by the appropriate processes quoted in the table, to achieve a cleanliness to enable the Inspection/Check to be carried out correctly. Where alternative processes are quoted, the operator must decide what process to use depending on the amount of contamination of the item. Any item that is not cleaned satisfactorily must be recleaned by the appropriate process.

OVERHAUL

- C. When an assembly item has attached parts that have certain protective finishes e.g. silver plating, the cleaning process for the assembly item may damage the finish of the part. To minimize the effect on the finish of the part, reduce the process immersion time to a minimum. If the finish is damaged, then the damaged finish will have to be replaced or reconditioned.

TUBES - OIL SUPPLY, TANK TO PUMP AND
ANTI-DRAIN CONNECTION - CLEANING

1. General

- A. Prior to commencing the cleaning refer to 72-09-00 Cleaning for details of the cleaning processes referred to in Table 201.
- B. To ensure that all items within this breakdown that require cleaning and subsequent Inspection/Check are recognized, and identified by their Part Number, figures are provided which equate with the Illustrated Parts Catalogue (I.P.C.). Thus, Fig.201 Item 10 equates with the relevant Figure and Item Number in the same breakdown in the I.P.C. Items illustrated in the I.P.C. which are not illustrated in this breakdown, are those items which are either discarded at overhaul, or are normally assembled to another item and are only called up by number.
- C. As all items requiring cleaning are illustrated in the figures, Table 201 does not list all items, but deals collectively with the items requiring the same cleaning process.
- D. On receipt of the items from disassembly, all protective blanks, covers etc. deemed necessary for the protection of the items will have been assembled and, in addition, many of the items will arrive in containers. Any special containers, blanks, covers etc. are listed in Table 202 by their Tool Ref. No. (Tool 123). For the manufacturer's Part No. refer to the appropriate Table in Special Tools, Fixtures and Equipment Section.

2. Cleaning Components

- A. All blanks, covers etc. must be removed from the items prior to cleaning and reassembled immediately afterwards. Items received in special cleaning containers should remain therein during the cleaning procedures unless otherwise stated.
- B. All items contained in this breakdown must be cleaned by the appropriate processes quoted in the table, to achieve a cleanliness to enable the Inspection/Check to be carried out correctly. Where alternative processes are quoted, the operator must decide what process to use depending on the amount of contamination of the item. Any item that is not cleaned satisfactorily must be recleaned by the appropriate process.

1. General

- A. Prior to commencing the cleaning refer to 72-09-00 Cleaning for details of the cleaning processes referred to in Table 201.
- B. To ensure that all items within this breakdown that require cleaning and subsequent Inspection/Check are recognized, and identified by their Part Number, figures are provided which equate with the Illustrated Parts Catalogue (I.P.C.). Thus, Fig.201 Item 10 equates with the relevant Figure and Item Number in the same breakdown in the I.P.C. Items illustrated in the I.P.C. which are not illustrated in this breakdown, are those items which are either discarded at overhaul, or are normally assembled to another item and are only called up by number.
- C. As all items requiring cleaning are illustrated in the figures, Table 201 does not list all items, but deals collectively with the items requiring the same cleaning process.
- D. On receipt of the items from disassembly, all protective blanks, covers etc. deemed necessary for the protection of the items will have been assembled and, in addition, many of the items will arrive in containers. Any special containers, blanks, covers etc. are listed in Table 202 by their Tool Ref. No. (Tool 123). For the manufacturer's Part No. refer to the appropriate Table in Special Tools, Fixtures and Equipment Section.

2. Cleaning Components

CAUTION: BEFORE USING HEAVY CLEANING PROCESSES J, L AND N, INVESTIGATE ALL REPAIRS CARRIED OUT ON EACH COMPONENT TO IDENTIFY THOSE HAVING PLASMA SPRAY COATINGS. THE NITRIC ACID USED IN PROCESSES J, L AND N WILL ATTACK THE ALUMINIUM CONTENT OF SOME TYPES OF COATING, MAKING REPLACEMENT OF THE COATING NECESSARY.

- A. All blanks, covers etc. must be removed from the items prior to cleaning and reassembled immediately afterwards. Items received in special cleaning containers should remain therein during the cleaning procedures unless otherwise stated.

TUBE - ANTI-DRAIN CONNECTION TO CONNECTION ON
TUBE, OIL COOLER TO OIL TANK - CLEANING

1. General

- A. Prior to commencing the cleaning refer to 72-09-00 Cleaning for details of the cleaning processes referred to in Table 201.
- B. To ensure that all items within this breakdown that require cleaning and subsequent Inspection/Check are recognized, and identified by their Part Number, figures are provided which equate with the Illustrated Parts Catalogue (I.P.C.). Thus, Fig.201 Item 10 equates with the relevant Figure and Item Number in the same breakdown in the I.P.C. Items illustrated in the I.P.C. which are not illustrated in this breakdown, are those items which are either discarded at overhaul, or are normally assembled to another item and are only called up by number.
- C. As all items requiring cleaning are illustrated in the figures, Table 201 does not list all items, but deals collectively with the items requiring the same cleaning process.
- D. On receipt of the items from disassembly, all protective blanks, covers etc. deemed necessary for the protection of the items will have been assembled and, in addition, many of the items will arrive in containers. Any special containers, blanks, covers etc. are listed in Table 202 by their Tool Ref. No. (Tool 123). For the manufacturer's Part No. refer to the appropriate Table in Special Tools, Fixtures and Equipment Section.

2. Cleaning Components

- A. All blanks, covers etc. must be removed from the items prior to cleaning and reassembled immediately afterwards. Items received in special cleaning containers should remain therein during the cleaning procedures unless otherwise stated.
- B. All items contained in this breakdown must be cleaned by the appropriate processes quoted in the table, to achieve a cleanliness to enable the Inspection/Check to be carried out correctly. Where alternative processes are quoted, the operator must decide what process to use depending on the amount of contamination of the item. Any item that is not cleaned satisfactorily must be recleaned by the appropriate process.

OIL SYSTEM INDICATION - INSPECTION/CHECK

1. General

- A. Each item in this chapter is given a two-part identification; thus, 302-20 refers to Figure 302 and to Item 20 called out on that figure. Each item may be further identified by its Part Number by the use of Table 303, which cross-refers figures in this chapter to the equivalent chapter and figure in the Illustrated Parts Catalogue (I.P.C.); the called-out item number will be the same on both figures.
- B. All items which will be crack tested are listed in Tables 301 and 302.
- C. Dimensional checks are cross referenced to the equivalent Fits and Clearances Schedule (F.C.S.) chapter against the item concerned.
- D. When the inspection of an item discloses a minor defect that requires rectification, it is defined as 'Accept after repair'. On all such occasions the item must be rectified in accordance with Standard Practices 72-09-22 Repair. Where a Ref.No. follows 'Accept after repair' e.g. (Ref.72-21-01 Repair No.1), a specific Repair Scheme is available to which the item must be rectified. Items that are rejected, or for which a repair scheme is not currently available, should be held at the discretion of the operator, as service experience may prove the need for a repair.
- E. On completion of a repair, rectification or test, the item(s) must be inspected, to ensure that the necessary work has been satisfactorily completed.

2. General Inspection

- A. Inspect all items illustrated in this chapter, whether specified or not, in accordance with Standard Practices (Ref.72-09-00 Inspection/Check). In addition, carry out the inspections detailed for the specified items, from para.4 onwards.
- B. Inspection terms used in this chapter are explained in Standard Practices (Ref.72-09-00 Inspection/Check).

3. Crack Detection

- A. Magnetic Particle Crack Detection.

- (1) Submit the items listed in Table 301 to crack detection in accordance with the process quoted.

INSPECTION/CHECK

(1) Wear and fretting.

(a) Attachment face thickness not reduced by more than 10 per cent. Accept.

(b) Bolt-holes elongated not more than 0.030 in. (0,760 mm) Accept after repair.

(2) Scoring.

(a) Not more than 0.010 in. (0,250 mm) in depth. Accept after repair providing material thickness is not reduced by more than 10 per cent.

(3) Nicks and burrs. Accept after repair.

(4) Distortion. Accept if compatibility is preserved.

OIL TANK CONTENTS TRANSMITTER AND OVERFULL SWITCH - CLEANING

1. General

- A. Prior to commencing the cleaning refer to 72-09-00 Cleaning for details of the cleaning processes referred to in Table 201.
- B. To ensure that all items within this breakdown that require cleaning and subsequent Inspection/Check are recognized, and identified by their Part Number, figures are provided which equate with the Illustrated Parts Catalogue (I.P.C.). Thus, Fig.201 Item 10 equates with the relevant Figure and Item Number in the same breakdown in the I.P.C. Items illustrated in the I.P.C. which are not illustrated in this breakdown, are those items which are either discarded at overhaul, or are normally assembled to another item and are only called up by number.
- C. As all items requiring cleaning are illustrated in the figures, Table 201 does not list all items, but deals collectively with the items requiring the same cleaning process.
- D. On receipt of the items from disassembly, all protective blanks, covers etc. deemed necessary for the protection of the items will have been assembled and, in addition, many of the items will arrive in containers. Any special containers, blanks, covers etc. are listed in Table 202 by their Tool Ref. No. (Tool 123). For the manufacturer's Part No. refer to the appropriate Table in Special Tools, Fixtures and Equipment Section.

2. Cleaning Components

- A. All blanks, covers etc. must be removed from the items prior to cleaning and reassembled immediately afterwards. Items received in special cleaning containers should remain therein during the cleaning procedures unless otherwise stated.
- B. All items contained in this breakdown must be cleaned by the appropriate processes quoted in the table, to achieve a cleanliness to enable the Inspection/Check to be carried out correctly. Where alternative processes are quoted, the operator must decide what process to use depending on the amount of contamination of the item. Any item that is not cleaned satisfactorily must be recleaned by the appropriate process.

OVERHAUL

- C. When an assembly item has attached parts that have certain protective finishes e.g. silver plating, the cleaning process for the assembly item may damage the finish of the part. To minimize the effect on the finish of the part, reduce the process immersion time to a minimum. If the finish is damaged, then the damaged finish will have to be replaced or reconditioned.

OVERHAUL

OIL TUBE FILTERS - CLEANING

1. General

- A. Prior to commencing the cleaning refer to 72-09-00 Cleaning for details of the cleaning processes referred to in Table 201.
- B. To ensure that all items within this breakdown that require cleaning and subsequent Inspection/Check are recognized, and identified by their Part Number, figures are provided which equate with the Illustrated Parts Catalogue (I.P.C.). Thus, Fig.201 Item 10 equates with the relevant Figure and Item Number in the same breakdown in the I.P.C. Items illustrated in the I.P.C. which are not illustrated in this breakdown, are those items which are either discarded at overhaul, or are normally assembled to another item and are only called up by number.
- C. As all items requiring cleaning are illustrated in the figures, Table 201 does not list all items, but deals collectively with the items requiring the same cleaning process.
- D. On receipt of the items from disassembly, all protective blanks, covers etc. deemed necessary for the protection of the items will have been assembled and, in addition, many of the items will arrive in containers. Any special containers, blanks, covers etc. are listed in Table 202 by their Tool Ref. No. (Tool 123). For the manufacturer's Part No. refer to the appropriate Table in Special Tools, Fixtures and Equipment Section.

2. Cleaning Components

- A. All blanks, covers etc. must be removed from the items prior to cleaning and reassembled immediately afterwards. Items received in special cleaning containers should remain therein during the cleaning procedures unless otherwise stated.
- B. All items contained in this breakdown must be cleaned by the appropriate processes quoted in the table, to achieve a cleanliness to enable the Inspection/Check to be carried out correctly. Where alternative processes are quoted, the operator must decide what process to use depending on the amount of contamination of the item. Any item that is not cleaned satisfactorily must be recleaned by the appropriate process.

- C. When an assembly item has attached parts that have certain protective finishes e.g. silver plating, the cleaning process for the assembly item may damage the finish of the part. To minimize the effect on the finish of the part, reduce the process immersion time to a minimum. If the finish is damaged, then the damaged finish will have to be replaced or reconditioned.
- D. Certain components are subject to Controlled Manufacturing Technique (CMT) procedures. The cleaning of these components is critical and variations from the specified cleaning procedures and solutions are prohibited without approval from the engine manufacturer. All components to which this applies are identified as such in the Remarks column of the Cleaning Processes Table.

OLYMPUS 593 OVERHAUL MANUAL

TEMPORARY REVISION No. 72-510
Insert in 72-09-00 before Page 201

REASON FOR ISSUE:

Alternative cleaning technique for stainless steel rigid tubing (MRA 60).

ACTION

In addition to cleaning processes already given for specific stainless steel rigid tubes, the following heavy cleaning processes are approved for all stainless steel rigid tubes if heavy cleaning is deemed necessary.

Process H

Or

Ardrox 690 followed by Ardrex 607 and Kerosine.

NOTE: Ardrex 690 will damage silver plating and short immersion times are advised.

OLYMPUS 593

MK.610-14-28

OVERHAUL

STANDARD PRACTICES - CLEANING

1. General

CAUTION: BEFORE USING HEAVY CLEANING PROCESSES J, L AND N, INVESTIGATE ALL REPAIRS CARRIED OUT ON EACH COMPONENT TO IDENTIFY THOSE HAVING PLASMA SPRAY COATINGS. THE NITRIC ACID USED IN PROCESSES J, L AND N WILL ATTACK THE ALUMINIUM CONTENT OF SOME TYPES OF PLASMA SPRAY COATING, MAKING REPLACEMENT OF THE COATING NECESSARY.

THE FOLLOWING COATINGS ARE AT RISK:

MSRR 9507/1	-	METCO 73
/2	-	METCO 81
/4	-	METCO 404
/5	-	METCO 450
/6	-	SHERITT GORDON NICKEL GRAPHITE (75/25)
/16	-	SHERITT GORDON NICKEL GRAPHITE (85/15)
/29	-	METCO 51
/35	-	METCO 447
/101	-	METCO 405
/103	-	METCOLOY 2
/105	-	METCO S.F. AL
/111	-	SPRABRONZE

METCO 447, 450 AND 405 ARE SOMETIMES USED AS BOND COATINGS.

- A. The processes detailed in this Chapter cover general cleaning of the engine components and do not include processes for stripping pack aluminizing, plating, plasma coating and chemical conversion coatings.
- B. Cleaning processes are sub-divided into light and heavy. Light cleaning will remove light surface soiling only, whereas heavy cleaning will remove paint, corrosion, scaling, etc. Where a high degree of cleanliness is required for certain components an ultrasonic cleaning process can be used under the control of the local laboratory.
- C. A letter is assigned to each process to facilitate identification. All components to be cleaned are tabulated in the relevant assembly cleaning Chapter, together with their recommended processes.

CLEANING

OLYMPUS 593

MK.610-14-28
OVERHAUL

- D. Certain components are subject to Controlled Manufacturing Technique (CMT) procedures. The cleaning of these components is critical and variations from the specified cleaning procedures and solutions are prohibited without approval of the engine manufacturers. All components to which this applies are identified as such in the Remarks column of the Cleaning Processes Table in the appropriate Chapter.
- E. Individual components of ball and roller bearings should be kept together in matched sets during cleaning procedures and outer races of assembled bearings rotated relatively to the inner races at frequent intervals.
- F. Only clean blanks, etc, shall be installed on cleaned components to avoid contaminating the components.
- G. Protect cleaned components against corrosion and place in containers for protection against damage during transit between operations (Ref.72-09-20 Repair).

2. Safety Precautions

- A. When handling chemicals, the precautions in the appropriate industrial regulations of the country concerned shall be observed. When proprietary products are used, the manufacturer's instructions shall be strictly followed.
- B. Operators must avoid contact with cleaning solutions and shall wear appropriate protective clothing and use barrier cream.
- C. In the event of an accident, operators must be aware of the immediate actions to be taken.
- D. Any skin contamination must receive immediate medical attention.

3. Cleaning Processes

- A. The recommended cleaning processes are tabulated subsequently and are also shown in the Process Control Chart (Ref.Fig.201). Cleaning solutions specified in the processes are detailed in para.4.

SEQUENCE	DESCRIPTION	SOLUTION	TIME	TEMP (deg C)
1	Primary cleaning	Tiket or Ardrox 6025	15-60 min	Tiket: 65 Ardrox 6025: Room
2	Cold water rinse	Water	As req'd	Room
3	Air/water pressure wash	Compressed air/water	As req'd	Room
4	Hot water wash	Water	As req'd	90-95
5	Temporary protection	De-watering oil	As req'd	Room

Process A - Light Cleaning (All Metals) Table 201

SEQUENCE	DESCRIPTION	SOLUTION	TIME	TEMP (deg C)

4. Cleaning Solutions

A. Ardrox 185.

- (1) This is a hot immersion type cleaner based on sodium hydroxide and sodium glucanate. It is used essentially on steels and heat resistant alloys for de-rusting and scale modifying purposes.
- (2) The solution should be made up to a concentration of 2-3 lb of Ardrox 185 per gal (Imp.) (200-300 g/l) of water. The tank should be filled with tap water and the required amount of powder added slowly with constant stirring. Alternatively, an aqueous solution may be made up as follows:

Sodium Hydroxide	16-36 oz/gal (Imp.) (100-200 g/l)
Sodium Glucanate	4-36 oz/gal (Imp.) (25-200 g/l)
Lissapol 'N'	0.5 oz/gal (Imp.) (3 g/l)

The concentration of the constituents can be varied according to the type of work. For the maximum rust removal rate, the solution should be used at 95 deg C and the sodium hydroxide/sodium glucanate ratio should be 1:1. The ratio may be as low as 4:1 provided a slower removal rate can be tolerated.

- (3) Application is by immersion.
- (4) The solution should be used to exhaustion. Solution control shall be either by discarding and making up a fresh solution or by laboratory analysis and making the appropriate additions. If the concentration of iron reaches 1/10 of the sodium glucanate concentration the solution shall be discarded.

B. Ardrox 188.

- (1) This is a hot immersion type scale conditioner.

CLEANING

OVERHAUL

- (2) The solution should be made up to the manufacturers instructions. Alternatively, an aqueous solution may be made up as follows:

Sodium Hydroxide	16-20 oz/gal (Imp.) (100-125 g/l)
Sodium Carbonate	16-20 oz/gal (Imp.) (100-125 g/l)
Potassium Permanganate	8-16 oz/gal (Imp.) (50-100 g/l)

The solution should be used at 90-105 deg C.

- (3) Application is by immersion.
- (4) The solution should be maintained at a constant level by the addition of water. Control shall be according to the instructions of the controlling laboratory.

C. Ardrex 664.

- (1) This is a methylene chloride type solution and is used for general cleaning, paint stripping and/or light decarbonizing. It is safe for use on aluminium alloys, magnesium alloys and steels for indefinite periods.
- (2) The solution is used as supplied. Because the solution is supplied with a water seal, the entire contents shall be emptied into the tank. Operation should be at room temperature.
- (3) Application is by immersion. The solution can be contained in a mild steel tank located in a well-ventilated area or, alternatively, equipped with a fume extraction system.
- (4) The water seal shall be maintained at a depth of at least 3 in. The alkalinity, inhibitor content and solvent content shall be checked periodically and replenishments made as required. Sludge shall be allowed to settle and shall be removed with a sludge tray or by decantation.

PRINTED IN ENGLAND

D. Ardrox 690.

- (1) This is a hot immersion type cleaner and paint stripper which contains orthodichlorobenzene, cresol, emulsifier, water and inhibitor. It is suitable for use on aluminium alloys, magnesium alloys and steels. The solution is used with an inhibited water seal.
- (2) The solution comprises three parts by volume of Ardrox 690 to one part by volume of water containing three per cent by weight inhibitor. It should be made up by adding the inhibitor powder to the water and stirring until dissolved, then adding the Ardrox solution and mixing thoroughly. The normal operating temperature should be 60-65 deg C, but up to 90 deg C is permissible for difficult deposits.
- (3) Application is by immersion below the water seal for a maximum period of six hours. The solution shall be contained in a mild steel tank equipped with a heating facility, lid, fume extraction system and a sludge tray.
- (4) The water seal shall be maintained at a depth of at least 4 in. The alkalinity, inhibitor content and solvent content shall be checked periodically and replenishments made as required. Sludge shall be allowed to settle and shall be removed with the sludge tray.

E. Ardrox 1871.

- (1) This is a de-scaling solution for nickel and/or cobalt based materials. It is not suitable for use on low alloy steels or high chromium content steels. It has no effect on pack aluminizing and only slight effect on chromium carbide plasma coatings.
- (2) The solution comprises one part by volume of compound to four parts by volume of water and should be used at 80-85 deg C. Components should be free from oil and carbonaceous deposits.
- (3) Application is by immersion.

OLYMPUS 593

MK.610-14-28
OVERHAUL

- (4) Solution control consists of determination of the concentration of Ardrox 1871 by titration with N/1 KOH to a pH value of 11.5.

F. Ardrox 1873.

- (1) This is an acidic de-scaling solution for nickel base alloy and corrosion resistant steels. It is not suitable for use on low alloy steels or high chromium content steels. Parts coated with sprayed metal or electroplate will be affected, and coatings must be renewed.
- (2) The solution comprises one part by volume of compound to four parts by volume of water, and should be used at 80-85°C. Components should be free from oil and carbonaceous deposits.
- (3) Application is by immersion. The solution should be contained in a stabilised stainless steel tank provided with a vapour exhaust system.
- (4) Solution control consists of maintaining the pH value between 3.0 and 3.2. If the pH value is high, add concentrated nitric acid to reduce it. If the pH value is low, add potassium hydroxide to raise it. An analysis must be carried out to determine the concentration of Ardrox 1873 in accordance with laboratory instructions. The solution should be discarded after 6 months use.

G. Ardrox 6025.

- (1) This is a cold emulsion liquid cleaner containing mild alkalies, surfactants and corrosion inhibitors. It is suitable for use on most metallic materials, including painted components.
- (2) The solution comprises one part by volume of Ardrox 6025 to nine parts by volume of water and should be used at room temperature.
- (3) Application is by immersion. The solution should be contained in a mild steel tank.
- (4) The solution should be renewed when it is no longer effective.

OLYMPUS 593
MK. 610-14-28
OVERHAUL

H. Caustic Soda.

- (1) This is hot alkaline immersion solution and is normally used in conjunction with Chromic Acid for stripping certain paints, lubricants and jointing compounds from steel and/or magnesium components. It must not be used on aluminium. In particular it is used for stripping aluminium pigmented heat resistant paints and phenolic varnishes. It can also be used for removing aluminium spatter. Alternatively, caustic glucanate can be used where caustic soda tanks are not available.
- (2) The solution comprises 10-20 per cent by volume sodium hydroxide in water, with the optional addition of 0.1 per cent by volume of a suitable wetting agent such as Shell Teepol P.40 or Lissapol 'N'. The sodium hydroxide should be added slowly to the water whilst stirring vigorously. The normal operating temperature should be 80-100 deg C, but for stripping thick deposits of aluminium the temperature may be lowered.
- (3) Application is by immersion.
- (4) The level of the solution should be maintained by the addition of water. The solution should be renewed when it is no longer effective.

J. Chromic Acid.

- (1) This is a hot immersion solution with inhibition properties. It is used to assist in the stripping of paints and jointing compounds, and the neutralization of alkaline residues from previous cleaning operations.
- (2) The solution comprises 10 per cent W/V chromic acid and 0.25 per cent W/V barium chromate dissolved in demineralized or distilled water. Operating temperature should be 65-75 deg C.
- (3) Application is by immersion.
- (4) The level of the solution should be maintained by the addition of demineralized or distilled water. Control should be by laboratory analysis and replenishing as required to maintain the chromic acid content at 7.5-10 per cent by volume.

K. Kerosine.

- (1) This is a light hydrocarbon cleaner used cold for the removal of oil, light oil sludge deposits and loose soils. It may also be used as a final wash off and flushing medium, prior to assembling components. It is satisfactory for use on all metals and organic finishes.
- (2) Kerosine should be used as supplied.
- (3) Application is by immersion, flush, spray or brush.
- (4) The kerosine should be discarded when contaminated.

L. Kerosine/Oil.

- (1) This solution is used solely for cleaning ball and roller bearings.
- (2) The solution comprises 70 per cent by volume Aviation Kerosine and 30 per cent by volume oil to D.Eng. R.D.2490 or the recommended engine oil. The operating temperature shall be 80-85 deg C.
- (3) Application is by immersion. Tanks should be of mild steel and equipped with a heating system. Thermostatic temperature control is essential.
- (4) The operating temperature shall be maintained at all times including shut-down periods to avoid water vapour contamination. The primary cleaning tank should be drained, cleaned and filled with fresh solution after cleaning approximately 100 bearings, or earlier if the solution is excessively contaminated. The secondary cleaning tank should be controlled similarly, except that its cleaning life may be extended and the solution level maintained by the addition of clean, fresh kerosine/oil.

M. Nitric Acid (Refer to CAUTION in paragraph 1).

- (1) This is a cold immersion solution and is used after scale and oxide modification solutions. In addition it is used for stain removal on aluminium, stainless steels and heat resistant alloys.

CLEANING

72-09-00

Page 227

OLYMPUS 593
MK.610-14-28
OVERHAUL

- (2) The solution comprises 30 per cent by volume nitric acid (sp. gr. 1.42) and 70 per cent by volume water and should be used at room temperature.
- (3) Application is by immersion.
- (4) Control is by laboratory analysis and replenishing as required to maintain the nitric acid content at 25-30 per cent by volume.

N. Sodium Hydroxide, Sodium Nitrate, Potassium Dichromate.

- (1) This solution is used for de-scaling titanium.
- (2) It is an aqueous solution containing:

Sodium Hydroxide (NaOH)	160 oz/gal (Imp.) (1000 g/l)
Sodium Nitrate (NaNO ₃)	2 oz/gal (Imp.) (12.5 g/l)
Potassium Dichromate (K ₂ Cr ₂ O ₇)	2 oz/gal (Imp.) (12.5 g/l)

The solution should be made up by adding the sodium hydroxide to the water and stirring until dissolved, then adding the sodium nitrate and potassium dichromate. It is essential that the sodium hydroxide is completely dissolved. The operating temperature shall be 138-143 deg C.

- (3) Application is by immersion. The solution should be contained in a shallow, mild steel tank equipped with a heating facility and a fume extraction system.
- (4) The solution is controlled by its boiling point in the range 138-143 deg C. If the boiling point rises above the top limit, water shall be added to reduce the boiling point to within the specified limits. Conversely, if the boiling point drops below the bottom limit, sodium hydroxide shall be added to restore the boiling point to within the specified limits. Any additions shall be made when the solution is cold and must be mixed in thoroughly to avoid eruptions.

P. Sodium Meta-silicate.

- (1) This is a hot immersion, mild alkaline cleaner which is used in conjunction with Ardrex 690 to assist in paint stripping and rinsing.
- (2) The solution comprises 3 per cent by volume sodium meta-silicate and 97 per cent by volume water. The operating temperature shall be 65-85 deg C.
- (3) Application is by immersion. The solution should be contained in a mild steel tank equipped with a heating facility and a fume extraction system.
- (4) The solution should be maintained at a constant level by the addition of water and shall be discarded when no longer effective.

Q. Tiket.

- (1) Diversey Tiket is a primary cleaner containing wetting agents, alkali detergents and a solvent. It is safe for use on most surfaces except cellulose and perspex.
- (2) The solution normally comprises one part by volume Tiket and eight parts by volume water, but other strengths may be used as required. The operating temperature should be 65 deg C for immersion and room temperature for brushing or spraying.
- (3) Application is by immersion, brush or spray.
- (4) The solution should be maintained at a constant level by the addition of water and shall be discarded when contaminated or when no longer effective.

R. White Spirit.

- (1) This is a light hydrocarbon cleaner used cold as an alternative to kerosine where cleaner surfaces and quicker drying properties are required.
- (2) White spirit should be used as supplied.
- (3) Application is by spray, brush or swabs.
- (4) The white spirit should be discarded when contaminated.

OLYMPUS 593
MK.610-14-28
OVERHAUL

S. Turco 4181.

- (1) This is a hot immersion alkaline cleaner and rust remover. It is suitable for use on steel and titanium metals.
- (2) The solution is generally used at a concentration of 2 lb per gallon (Imp.) (200 g/l) of water, but may be used at any concentration between 0.5 and 3.5 lb per gallon (Imp.) (50 and 350 g/l). The operating temperature should be between 82 and 90°C (185 and 195 °F).
- (3) Application is by immersion. The solution can be contained in a mild steel tank equipped with temperature control, agitation and a vapour exhaust system.
- (4) The solution should be renewed when it is no longer effective.

T. Turco 4338-C.

- (1) This is a strongly alkaline, highly oxidising, hot immersion type scale conditioner.
- (2) The solution is used at a concentration of 2 to 2.5 lb per gallon (Imp.) (200 to 250 g/l) of water. The operating temperature should be between 88 and 93 °C.
- (3) Application is by immersion. The solution can be contained in a stainless steel tank equipped with temperature control, agitation and a sludge tray.
- (4) The solution should be maintained at a constant level by the addition of water. The concentration of the solution can be restored by cooling the solution, then carefully sprinkling on the powder whilst agitating the tank. Control shall be according to the instructions of the controlling laboratory.

U. Turco 4931.

- (1) This is an acidic de-scaling solution for stainless steels and high temperature alloys.
- (2) The solution is used at a concentration of 14.4 oz per gallon (Imp.) (90 g/l) of water. The operating temperature should be between 49 and 54°C.

- (3) Application is by immersion. The solution should be contained in a suitable acid resistant tank provided with a vapour exhaust system.
- (4) The solution should be renewed when it is no longer effective. Control shall be according to the instructions of the controlling laboratory.

V. Alkaline Permanganate.

- (1) This is a hot immersion type scale conditioner based on sodium hydroxide and potassium permanganate. It is used essentially on steels and heat resistant alloys for scale modifying purposes.

- (2) An aqueous solution should be made up as follows:

Sodium Hydroxide ... 0.8-1.2 lb/gall (80-120 g/l)

Potassium Permanganate ... 0.3-0.6 lb/gall (30-60 g/l)

The tank should be half filled with water and the required amount of Sodium Hydroxide added slowly and with constant stirring. When fully dissolved add the required amount of Potassium Permanganate and mix well. When fully dissolved fill tank to working level with water. The solution should be maintained between 85-95 deg.C.

- (3) Application is by immersion.
- (4) Solution control should be as follows:

Temperature check Daily.

Tank level check Beginning of each application.

Concentration check Weekly or when efficiency is reduced.

NaOH 0.8-1.2 lb/gall (80-120 g/l)

KMnO₄ 0.3-0.6 lb/gall (30-60 g/l)

5. Vapour Degreasing

A. General.

(1) Vapour degreasing is a cleaning method where the component (at room temperature) is suspended in solvent vapour and the condensing vapour carries away oil and grease from the component surfaces. When the component reaches the vapour temperature the degreasing action ceases. If further degreasing is necessary the component must be removed from the vapour, allowed to cool to room temperature, then re-inserted in the vapour.

(2) Degreasing of aluminium and its alloys with chlorinated hydrocarbon solvents can, under certain conditions, lead to immediate local breakdown of the solvent with subsequent attack at metallic interfaces.

Risk of attack can be minimised by the use of non-metallic supports e.g. Polypropylene hooks, slings and baskets, prevention of contact interfaces as far as possible and the damping of all sources of vibration.

(3) The approved solvents for vapour degreasing are:

(a) Trichlorethylene (Triklone N) to BS.580:1963, Type 2.

(b) 1.1.1. Trichloroethane (Chlorothene VG) to MIL-T-81533A.

(c) Trifluorotrichloroethane to BS.4849.

(4) The degreasing plant shall be a standard vapour or liquid/vapour degreasing unit. Operation shall be in accordance with the manufacturers instructions. There must be a suitable indication of which type of solvent is contained in the plant. The solvent type shall not be changed without approval from the controlling laboratory.

(5) Control of the solvent shall be in accordance with the instructions of the controlling laboratory.

CLEANING

PRINTED IN ENGLAND

B. Safety Precautions.

- (1) Operators shall wear protective clothing, including gloves and goggles or a face shield.
- (2) Personnel shall not inhale the vapours or smoke in the vicinity of the plant. Welding equipment, naked lights, steam cleaning equipment or other similar heat or flame generating equipment shall not be used in the vicinity of the plant.
- (3) In the event of accidental contamination of the skin or eyes, medical attention shall be sought immediately.

C. Procedure.

NOTE: Components manufactured from titanium alloy containing 5 per cent Al and 2.5 per cent Sn may require stress relieving prior to vapour degreasing. Such components shall be referred to the controlling laboratory.

- (1) Remove any gross contamination from the component using kerosine.
- (2) Load the component into a basket or a suitable sling, ensuring that any blind holes, cavities, etc are positioned to be self draining.

CAUTION: DO NOT PLACE WET, MOIST OR WARM COMPONENTS IN THE VAPOUR.

- (3) Lower the component slowly into the vapour.

CAUTION: DO NOT IMMERSE TITANIUM COMPONENTS IN THE VAPOUR FOR LONGER THAN 30 MIN TOTAL IN ANY ONE DEGREASING OPERATION, AND REMOVE ALL TRACES OF SOLVENT IMMEDIATELY AFTER REMOVING THESE COMPONENTS FROM THE VAPOUR.

- (4) When condensation ceases slowly remove the component from the vapour and allow to cool to room temperature.
- (5) Mop up any remaining traces of solvent using a clean, dry, lint-free cloth.
- (6) Repeat the preceding sequence of operations (preferably suspending the component in a different attitude each time) until all traces of contamination are removed.

6. Swab Degreasing

A. General.

- (1) Swab degreasing is a method for cleaning specific areas of a component by means of a swab soaked with unheated approved solvent.
- (2) The list of approved solvents for swab degreasing are given in Table 214C - Approved Solvents.

B. Safety Precautions.

- (1) Operators shall wear protective clothing, including gloves and goggles or a face shield.
- (2) Personnel shall not inhale the vapour or smoke in the vicinity of the degreasing area. Welding equipment, naked lights, steam cleaning or other similar heat or flame generating equipment shall not be used in the vicinity of the degreasing area.
- (3) In the event of accidental contamination of the skin or eyes, medical attention shall be sought immediately.

C. Procedure.

- (1) Moisten a clean lint-free cloth with cold approved solvent (Ref. Table 214C).

NOTE: Use of a dispenser that allows the degreasing agent to run on to the cloth is recommended to avoid contaminating the bulk of the liquid.

- (2) Swab the area to be degreased with the moistened cloth and use a fresh cloth for each separate degreasing operation.
- (3) Dispose of soiled cloths after use.

7. Temporary Protection of Bearings

A. General.

- (1) A 14 day temporary corrosion protection should be applied to all bearings after cleaning then placed in clean polythene or PVC bags with date and identification.
- (2) Bearings which have been subject to unavoidable delays and the temporary protection limit expired shall be referred to Inspection before proceeding with the cleaning operation. For periods greater than 14 days and less than 3 months protect the bearings as detailed in table 204 sequence 6 and 205 sequence 8.
- (3) Bearings and journals which are not disassembled from their shafts shall receive the same protective treatment, but as it is not always possible to immerse the complete shaft in a protective solution it can be applied by brush.

8. Ultrasonic Cleaning

A. General.

- (1) The ultrasonic cleaning process supplements the normal, conventional cleaning methods and is employed as a final stage in the cleaning of parts where a high degree of cleanliness is required on all metals and other hard surface materials.
- (2) The controlling laboratory must be referred to for process approval as some of the chemicals and processes may be hazardous to health and/or safety.

B. Cleaning Solutions.

Cleaning solutions are classified as either solvent, aqueous or alkaline types. Where components carry a high risk of debris entrapment a digestive type of solution, ammoniated citric acid solution is recommended (refer to para.D). The Controlling Laboratory must be consulted as to the type of cleaning solution to be used for a component.

(1) Solvent Type.

- (a) Trichloroethylene (TRIKLONE N) BS580 type 2.
- (b) White spirit.

(2) Aqueous Detergent Type.

- (a) 1% max v/v Synperonic N in water.

(3) Alkaline.

(a) 1 to 3% v/v Ardrex 185 in water.

NOTE: Alternative solutions may be used with the written approval of the Controlling Laboratory.

C. Procedure.

- (1) The ultrasonic cleaning plant shall be operated strictly in accordance with the manufacturers instructions.
- (2) The preferred cleaning frequency shall be in the 20 Kcs range.
- (3) Components shall be suspended in the solution so as to ensure that internal passages are filled by the cleaning solution and positioned so that the main passages are vertical to the base of the transducer tank. Where a passage varies in size the larger diameter should be positioned facing the transducer.
- (4) Only one layer of components should be cleaned at any one time as ultrasonic waves will be absorbed in large masses.
- (5) Components shall be subjected to the cleaning process for approximately 2/10 minutes, depending on the size and complexity.
- (6) Reposition those components having more than one internal passage to ensure they have been in the vertical position for at least one cleaning period.
- (7) After cleaning, components which have been immersed in non-aqueous solvents may be allowed to air dry. Components cleaned in alkaline or detergent type solutions shall be washed in water to remove all traces of solution, then air dried after immersion in hot water heated to 90 deg.C minimum temperature.

CLEANING

Page 236

Dec 31/01

**OLYMPUS 593**MK.610-14-28
OVERHAUL

- (8) Ultrasonically cleaned components shall then be protected against further contamination and corrosion by wrapping the component in VP1 paper enclosed in a polythene bag. If the components are not required for immediate use also enclose the part number.

D. Ammoniated Citric Acid Solution.

- (1) Grant and West 650.
(2) Oakite MOR.

These concentrates are used at a strength between 5 and 10% by volume, the diluent shall be distilled or demineralised water. Ammonium hydroxide shall be used to adjust the pH value of the solutions to between 3.5 and 4.0.

- (3) SDG.3.

This is an aqueous solution containing, Citric Acid
($\text{HOC/CH}_2\text{CO}_2\text{H H}_2\text{O}$) 2.0 g/l
Ethylene Diamine Tetra (Acetic Acid-EDTA)
($\text{CH}_2\text{N}(\text{CH}_2\text{COOH})_2$) 2 1.0 g/l
Non-ionic Surface Active Agent 1.0 ml/l
i.e. Synperonic N containing 20%
active agent 5.0 ml/l
(Ammonium Hydroxide (NH_4OH) or) sufficient to adjust
(Sodium Carbonate (Na_2CO_3)) pH value to between
3.5 and
4.0

Distilled or de-ionised water for balance.

E. Procedure.

- (1) One litre of the solution shall be made up as follows:
Heat 900 ml of water to 45/50 deg.C. Add 2g of Citric Acid stirring until dissolved, then 1g of Edta stirring until dissolved. Add 5 ml of Synperonic N, stirring until dispersed.
- (2) Cool the solution to room temperature and adjust the pH value by the addition of ammonium hydroxide or sodium carbonate solution. Adjust the volume to 1 litre with water.
- (3) Temperature.

For maximum efficiency the solutions used should be hot but a maximum temperature of 60 deg.C should not be exceeded for Grant and West 650 or Oakite MOR, and 65/70 deg.C for SDG3.

sneema

F. Control.

Solutions must be analysed and maintained by suitable additions including controlling the pH value within the recommended limits. Alternatively the solution may be discarded at the discretion of the local Controlling Laboratory.

9. Coating Identification Markings

A. General.

- (1) Coating symbols are used to identify engine components that have been salvaged by using a hard coating or plating to restore them to a serviceable condition. Unless coatings are identified, cleaning fluids that can safely be used on uncoated components could remove or degrade the coating, making the component unserviceable.
- (2) Table 215 contains a list of coatings used for repair and the codes used to identify them. Table 216 contains a list of suitable cleaning processes for various combinations of coating and component material.
- (3) When the component cannot satisfactorily be cleaned using a process as listed in Table 216, then it may be necessary to employ one likely to affect the coating. Therefore it must be assumed that the coating will be damaged and must be replaced. Where instructions are not included in the manual, the advice of Rolls-Royce plc must be sought.
- (4) The effect of the cleaning process specified for the component must be assessed before cleaning (Refer to Table 216).

B. Application.

- (1) The existence of a coating is denoted by a diamond symbol .
- (2) A two-letter code inside the diamond identifies the coating (Ref. Tables 215 and 216). For example,  denotes a nickel chromium aluminium coating (Metco 443).

AIR INTAKE FAIRING - CLEANING

1. General

- A. Prior to commencing the cleaning refer to 72-09-00 Cleaning for details of the cleaning processes referred to in Table 201.
- B. To ensure that all items within this breakdown that require cleaning and subsequent Inspection/Check are recognized, and identified by their Part Number, figures are provided which equate with the Illustrated Parts Catalogue (I.P.C.). Thus, Fig.201 Item 10 equates with the relevant Figure and Item Number in the same breakdown in the I.P.C. Items illustrated in the I.P.C. which are not illustrated in this breakdown, are those items which are either discarded at overhaul, or are normally assembled to another item and are only called up by number.
- C. As all items requiring cleaning are illustrated in the figures, Table 201 does not list all items, but deals collectively with the items requiring the same cleaning process.
- D. On receipt of the items from disassembly, all protective blanks, covers etc. deemed necessary for the protection of the items will have been assembled and, in addition, many of the items will arrive in containers. Any special containers, blanks, covers etc. are listed in Table 202 by their Tool Ref. No. (Tool 123). For the manufacturer's Part No. refer to the appropriate Table in Special Tools, Fixtures and Equipment Section.

2. Cleaning Components

- A. All blanks, covers etc. must be removed from the items prior to cleaning and reassembled immediately afterwards. Items received in special cleaning containers should remain therein during the cleaning procedures unless otherwise stated.
- B. All items contained in this breakdown must be cleaned by the appropriate processes quoted in the table, to achieve a cleanliness to enable the Inspection/Check to be carried out correctly. Where alternative processes are quoted, the operator must decide what process to use depending on the amount of contamination of the item. Any item that is not cleaned satisfactorily must be recleaned by the appropriate process.

OVERHAUL

- C. When an assembly item has attached parts that have certain protective finishes e.g. silver plating, the cleaning process for the assembly item may damage the finish of the part. To minimize the effect on the finish of the part, reduce the process immersion time to a minimum. If the finish is damaged, then the damaged finish will have to be replaced or reconditioned.
- D. Certain components are subject to Controlled Manufacturing Technique (CMT) procedures. The cleaning of these components is critical and variations from the specified cleaning procedures and solutions are prohibited without approval from the engine manufacturer. All components to which this applies are identified as such in the Remarks column of the Cleaning Processes Table.

AIR INTAKE CASE - CLEANING

1. General

- A. Prior to commencing the cleaning refer to 72-09-00
Cleaning for details of the cleaning processes referred
to in Table 201.
- B. To ensure that all items within this breakdown that
require cleaning and subsequent Inspection/Check are
recognized, and identified by their Part Number, figures
are provided which equate with the Illustrated Parts
Catalogue (I.P.C.). Thus, Fig.201 Item 10 equates with
the relevant Figure and Item Number in the same breakdown
in the I.P.C. Items illustrated in the I.P.C. which are
not illustrated in this breakdown, are those items which
are either discarded at overhaul, or are normally assembled
to another item and are only called up by number.
- C. As all items requiring cleaning are illustrated in the
figures, Table 201 does not list all items, but deals
collectively with the items requiring the same cleaning
process.
- D. On receipt of the items from disassembly, all protective
blanks, covers etc. deemed necessary for the protection
of the items will have been assembled and, in addition,
many of the items will arrive in containers. Any special
containers, blanks, covers etc. are listed in Table 202
by their Tool Ref. No. (Tool 123). For the manufacturer's
Part No. refer to the appropriate Table in Special Tools,
Fixtures and Equipment Section.

2. Cleaning Components

CAUTION: BEFORE USING HEAVY CLEANING PROCESSES J, L AND N,
INVESTIGATE ALL REPAIRS CARRIED OUT ON EACH COM-
PONENT TO IDENTIFY THOSE HAVING PLASMA SPRAY
COATINGS. THE NITRIC ACID USED IN PROCESSES J, L
AND N WILL ATTACK THE ALUMINIUM CONTENT OF SOME
TYPES OF COATING, MAKING REPLACEMENT OF THE COATING
NECESSARY.

- A. All blanks, covers etc. must be removed from the items
prior to cleaning and reassembled immediately afterwards.
Items received in special cleaning containers should remain
therein during the cleaning procedures unless otherwise
stated.

LP COMPRESSOR EXIT GUIDE CASE AND VANES - CLEANING

1. General

- A. Prior to commencing the cleaning refer to 72-09-00
Cleaning for details of the cleaning processes referred
to in Table 201.
- B. To ensure that all items within this breakdown that
require cleaning and subsequent Inspection/Check are
recognized, and identified by their Part Number, figures
are provided which equate with the Illustrated Parts
Catalogue (I.P.C.). Thus, Fig.201 Item 10 equates with
the relevant Figure and Item Number in the same breakdown
in the I.P.C. Items illustrated in the I.P.C. which are
not illustrated in this breakdown, are those items which
are either discarded at overhaul, or are normally assembled
to another item and are only called up by number.
- C. As all items requiring cleaning are illustrated in the
figures, Table 201 does not list all items, but deals
collectively with the items requiring the same cleaning
process.
- D. On receipt of the items from disassembly, all protective
blanks, covers etc. deemed necessary for the protection
of the items will have been assembled and, in addition,
many of the items will arrive in containers. Any special
containers, blanks, covers etc. are listed in Table 202
by their Tool Ref. No. (Tool 123). For the manufacturer's
Part No. refer to the appropriate Table in Special Tools,
Fixtures and Equipment Section.

2. Cleaning Components

CAUTION: BEFORE USING HEAVY CLEANING PROCESSES J, L AND N,
INVESTIGATE ALL REPAIRS CARRIED OUT ON EACH COM-
PONENT TO IDENTIFY THOSE HAVING PLASMA SPRAY
COATINGS. THE NITRIC ACID USED IN PROCESSES J, L
AND N WILL ATTACK THE ALUMINIUM CONTENT OF SOME
TYPES OF COATING, MAKING REPLACEMENT OF THE COATING
NECESSARY.

- A. All blanks, covers etc. must be removed from the items
prior to cleaning and reassembled immediately afterwards.
Items received in special cleaning containers should remain
therein during the cleaning procedures unless otherwise
stated.

MK.610-14-28

OVERHAUL

- B. All items contained in this breakdown must be cleaned by the appropriate processes quoted in the table, to achieve a cleanliness to enable the Inspection/Check to be carried out correctly. Where alternative processes are quoted, the operator must decide what process to use depending on the amount of contamination of the item. Any item that is not cleaned satisfactorily must be recleaned by the appropriate process.
- C. When an assembly item has attached parts that have certain protective finishes e.g. silver plating, the cleaning process for the assembly item may damage the finish of the part. To minimize the effect on the finish of the part, reduce the process immersion time to a minimum. If the finish is damaged, then the damaged finish will have to be replaced or reconditioned.
- D. Certain components are subject to Controlled Manufacturing Technique (CMT) procedures. The cleaning of these components is critical and variations from the specified cleaning procedures and solutions are prohibited without approval from the engine manufacturer. All components to which this applies are identified as such in the Remarks column of the Cleaning Processes Table.

Thus, Fig.201 Item 10 equates with the relevant Figure and Item Number in the same breakdown in the I.P.C. Items illustrated in the I.P.C. which are not illustrated in this breakdown, are those items which are either discarded at overhaul, or are normally assembled to another item and are only called up by number.
- C. As all items requiring cleaning are illustrated in the figures, Table 201 does not list all items, but deals collectively with the items requiring the same cleaning process.
- D. On receipt of the items from disassembly, all protective blanks, covers etc. deemed necessary for the protection of the items will have been assembled and, in addition, many of the items will arrive in containers. Any special containers, blanks, covers etc. are listed in Table 202 by their Tool Ref. No. (Tool 123). For the manufacturer's Part No. refer to the appropriate Table in Special Tools, Fixtures and Equipment Section.

2. Cleaning Components

- A. All blanks, covers etc. must be removed from the items prior to cleaning and reassembled immediately afterwards. Items received in special cleaning containers should remain therein during the cleaning procedures unless otherwise stated.
- B. All items contained in this breakdown must be cleaned by the appropriate processes quoted in the table, to achieve a cleanliness to enable the Inspection/Check to be carried out correctly. Where alternative processes are quoted, the operator must decide what process to use depending on the amount of contamination of the item. Any item that is not cleaned satisfactorily must be recleaned by the appropriate process.

OVERHAUL

- C. When an assembly item has attached parts that have certain protective finishes e.g. silver plating, the cleaning process for the assembly item may damage the finish of the part. To minimize the effect on the finish of the part, reduce the process immersion time to a minimum. If the finish is damaged, then the damaged finish will have to be replaced or reconditioned.
- D. Certain components are subject to Controlled Manufacturing Technique (CMT) procedures. The cleaning of these components is critical and variations from the specified cleaning procedures and solutions are prohibited without approval from the engine manufacturer. All components to which this applies are identified as such in the Remarks column of the Cleaning Processes Table.

COMPRESSOR INTERMEDIATE CASE ASSEMBLY - CLEANING

1. General

- A. Prior to commencing the cleaning refer to 72-09-00
Cleaning for details of the cleaning processes referred
to in Table 201.
- B. To ensure that all items within this breakdown that
require cleaning and subsequent Inspection/Check are
recognized, and identified by their Part Number, figures
are provided which equate with the Illustrated Parts
Catalogue (I.P.C.). Thus, Fig.201 Item 10 equates with
the relevant Figure and Item Number in the same breakdown
in the I.P.C. Items illustrated in the I.P.C. which are
not illustrated in this breakdown, are those items which
are either discarded at overhaul, or are normally assembled
to another item and are only called up by number.
- C. As all items requiring cleaning are illustrated in the
figures, Table 201 does not list all items, but deals
collectively with the items requiring the same cleaning
process.
- D. On receipt of the items from disassembly, all protective
blanks, covers etc. deemed necessary for the protection
of the items will have been assembled and, in addition,
many of the items will arrive in containers. Any special
containers, blanks, covers etc. are listed in Table 202
by their Tool Ref. No. (Tool 123). For the manufacturer's
Part No. refer to the appropriate Table in Special Tools,
Fixtures and Equipment Section.

2. Cleaning Components

CAUTION: BEFORE USING HEAVY CLEANING PROCESSES J, L AND N,
INVESTIGATE ALL REPAIRS CARRIED OUT ON EACH COM-
PONENT TO IDENTIFY THOSE HAVING PLASMA SPRAY
COATINGS. THE NITRIC ACID USED IN PROCESSES J, L
AND N WILL ATTACK THE ALUMINIUM CONTENT OF SOME
TYPES OF COATING, MAKING REPLACEMENT OF THE COATING
NECESSARY.

- A. All blanks, covers etc. must be removed from the items
prior to cleaning and reassembled immediately afterwards.
Items received in special cleaning containers should
remain therein during the cleaning procedures unless
otherwise stated.

HP COMPRESSOR CASE AND VANES - CLEANING

1. General

- A. Prior to commencing the cleaning refer to 72-09-00 Cleaning for details of the cleaning processes referred to in Table 201.
- B. To ensure that all items within this breakdown that require cleaning and subsequent Inspection/Check are recognized, and identified by their Part Number, figures are provided which equate with the Illustrated Parts Catalogue (I.P.C.). Thus, Fig.201 Item 10 equates with the relevant Figure and Item Number in the same breakdown in the I.P.C. Items illustrated in the I.P.C. which are not illustrated in this breakdown, are those items which are either discarded at overhaul, or are normally assembled to another item and are only called up by number.
- C. As all items requiring cleaning are illustrated in the figures, Table 201 does not list all items, but deals collectively with the items requiring the same cleaning process.
- D. On receipt of the items from disassembly, all protective blanks, covers etc. deemed necessary for the protection of the items will have been assembled and, in addition, many of the items will arrive in containers. Any special containers, blanks, covers etc. are listed in Table 202 by their Tool Ref. No. (Tool 123). For the manufacturer's Part No. refer to the appropriate Table in Special Tools, Fixtures and Equipment Section.

2. Cleaning Components

CAUTION: BEFORE USING HEAVY CLEANING PROCESSES J, L AND N, INVESTIGATE ALL REPAIRS CARRIED OUT ON EACH COMPONENT TO IDENTIFY THOSE HAVING PLASMA SPRAY COATINGS. THE NITRIC ACID USED IN PROCESSES J, L AND N WILL ATTACK THE ALUMINIUM CONTENT OF SOME TYPES OF COATING, MAKING REPLACEMENT OF THE COATING NECESSARY.

- A. All blanks, covers etc. must be removed from the items prior to cleaning and reassembled immediately afterwards. Items received in special cleaning containers should remain therein during the cleaning procedures unless otherwise stated.

HP COMPRESSOR ROTOR - CLEANING

1. General

- A. Prior to commencing the cleaning refer to 72-09-00 Cleaning for details of the cleaning processes referred to in Table 201.
- B. To ensure that all items within this breakdown that require cleaning and subsequent Inspection/Check are recognized, and identified by their Part Number, figures are provided which equate with the Illustrated Parts Catalogue (I.P.C.). Thus, Fig.201 Item 10 equates with the relevant Figure and Item Number in the same breakdown in the I.P.C. Items illustrated in the I.P.C. which are not illustrated in this breakdown, are those items which are either discarded at overhaul, or are normally assembled to another item and are only called up by number.
- C. As all items requiring cleaning are illustrated in the figures, Table 201 does not list all items, but deals collectively with the items requiring the same cleaning process.
- D. On receipt of the items from disassembly, all protective blanks, covers etc. deemed necessary for the protection of the items will have been assembled and, in addition, many of the items will arrive in containers. Any special containers, blanks, covers etc. are listed in Table 202 by their Tool Ref. No. (Tool 123). For the manufacturer's Part No. refer to the appropriate Table in Special Tools, Fixtures and Equipment Section.

2. Cleaning Components

CAUTION: BEFORE USING HEAVY CLEANING PROCESSES J, L AND N, INVESTIGATE ALL REPAIRS CARRIED OUT ON EACH COMPONENT TO IDENTIFY THOSE HAVING PLASMA SPRAY COATINGS. THE NITRIC ACID USED IN PROCESSES J, L AND N WILL ATTACK THE ALUMINIUM CONTENT OF SOME TYPES OF COATING, MAKING REPLACEMENT OF THE COATING NECESSARY.

- A. All blanks, covers etc. must be removed from the items prior to cleaning and reassembled immediately afterwards. Items received in special cleaning containers should remain therein during the cleaning procedures unless otherwise stated.

- B. All items contained in this breakdown must be cleaned by the appropriate processes quoted in the table, to achieve a cleanliness to enable the Inspection/Check to be carried out correctly. Where alternative processes are quoted, the operator must decide what process to use depending on the amount of contamination of the item. Any item that is not cleaned satisfactorily must be recleaned by the appropriate process.
- C. When an assembly item has attached parts that have certain protective finishes e.g. silver plating, the cleaning process for the assembly item may damage the finish of the part. To minimize the effect on the finish of the part, reduce the process immersion time to a minimum. If the finish is damaged, then the damaged finish will have to be replaced or reconditioned.
- D. Certain components are subject to Component Manufacturing Technique (CMT) controlled procedures. The cleaning of these components is critical and variations from the specified cleaning procedures and solutions are prohibited without approval from the engine manufacturer. All components to which this applies are identified as such in the Remarks column of the Cleaning Processes Table.
- E. Clean HP Compressor Drive Shaft.
 - (1) Pre-clean using light process A or B (Refer 72-09-00 Cleaning).
 - CAUTION:** BEFORE INSTALLATION OF TOOLING, THE TOOL SILICONE SEALS MUST BE INSPECTED FOR CONDITION, I.E. DEGRADATION, NICKS AND TEARS ETC. REPLACE SEALS IF FOUND TO BE DEFECTIVE IN ANY WAY.
 - (2) Install masking tool (Ref.Tool Item 3143) to drive shaft (Refer to Fig.204).
 - (3) Clean using the preferred cleaning process shown in Figure 1 of Service Bulletin OL.593-72-8951-364 (Process R).
 - (4) Remove masking tool and inspect for the presence of cleaning fluids in the spigot region of the drive shaft.
 - (5) Report/record any contamination by cleaning fluids found during previously detailed inspection.

OVERHAUL

- (6) Hand clean component during final cold water rinse.

NOTE: To obtain the level of cleanliness required for penetrant inspection, the component must be free of any in-service contaminants, especially in the labyrinth mounting bolt holes. The component is considered clean when all blackened areas are removed and a bright metallic surface is evident.

- (a) Clean bolt holes during the final cold water washing operation, using a very fine abrasive pad, such as Scotchbrite grade 447. It must be applied as a hand operation only and must not be accompanied by a power operated aid.
- (b) Inspect resulting surface for cleanliness. If the surface is unsatisfactory for penetrant inspection, repeat the cleaning procedure as many times as is necessary to achieve the desired standard of cleanliness (Ref.72-09-00, Cleaning, Fig.201).

- F. Clean Ring, Spacer, Stages 3-4, 4-5, 5-6, 6-7 and Disk, Compressor, Stages 4, 5, 6 and 7.

- (1) Clean using the preferred cleaning process shown in Figure 1 of Service Bulletin OL.593-72-8951-364 (Process R).

- (2) Hand clean component during final cold water rinse.

NOTE: To obtain the level of cleanliness required for penetrant inspection, the component must be free of any in-service contaminants, especially in the bolt holes, spigot radius and blade root slots. The component is considered clean when all blackened areas are removed and a bright metallic surface is evident.

- (a) Clean the bolt holes, spigot radius and blade root slots during the final cold water washing operation, using a very fine abrasive pad, such as Scotchbrite grade 447. It must be applied as a hand operation only and must not be accompanied by a power operated aid.

HP COMPRESSOR DIFFUSER CASE ASSEMBLY - CLEANING

1. General

- A. Prior to commencing the cleaning refer to 72-09-00 Cleaning for details of the cleaning processes referred to in Table 201.
- B. To ensure that all items within this breakdown that require cleaning and subsequent Inspection/Check are recognized, and identified by their Part Number, figures are provided which equate with the Illustrated Parts Catalogue (I.P.C.). Thus, Fig.201 Item 10 equates with the relevant Figure and Item Number in the same breakdown in the I.P.C. Items illustrated in the I.P.C. which are not illustrated in this breakdown, are those items which are either discarded at overhaul, or are normally assembled to another item and are only called up by number.
- C. As all items requiring cleaning are illustrated in the figures, Table 201 does not list all items, but deals collectively with the items requiring the same cleaning process.
- D. On receipt of the items from disassembly, all protective blanks, covers etc. deemed necessary for the protection of the items will have been assembled and, in addition, many of the items will arrive in containers. Any special containers, blanks, covers etc. are listed in Table 202 by their Tool Ref. No. (Tool 123). For the manufacturer's Part No. refer to the appropriate Table in Special Tools, Fixtures and Equipment Section.

2. Cleaning Components

CAUTION: BEFORE USING HEAVY CLEANING PROCESSES J, L AND N, INVESTIGATE ALL REPAIRS CARRIED OUT ON EACH COMPONENT TO IDENTIFY THOSE HAVING PLASMA SPRAY COATINGS. THE NITRIC ACID USED IN PROCESSES J, L AND N WILL ATTACK THE ALUMINIUM CONTENT OF SOME TYPES OF COATING, MAKING REPLACEMENT OF THE COATING NECESSARY.

- A. All blanks, covers etc. must be removed from the items prior to cleaning and reassembled immediately afterwards. Items received in special cleaning containers should remain therein during the cleaning procedures unless otherwise stated.

CLEANING

72-34-00

Page 201
Feb 1/83

OLYMPUS 593

MK.610-14-28

OVERHAUL

- B. All items contained in this breakdown must be cleaned by the appropriate processes quoted in the table, to achieve a cleanliness to enable the Inspection/Check to be carried out correctly. Where alternative processes are quoted, the operator must decide what process to use depending on the amount of contamination of the item. Any item that is not cleaned satisfactorily must be recleaned by the appropriate process.
- C. When an assembly item has attached parts that have certain protective finishes e.g. silver plating, the cleaning process for the assembly item may damage the finish of the part. To minimize the effect on the finish of the part, reduce the process immersion time to a minimum. If the finish is damaged, then the damaged finish will have to be replaced or reconditioned.
- D. Certain components are subject to Controlled Manufacturing Technique (CMT) procedures. The cleaning of these components is critical and variations from the specified cleaning procedures and solutions are prohibited without approval from the engine manufacturer. All components to which this applies are identified as such in the Remarks column of the Cleaning Processes Table.

HP TURBINE BEARING SUPPORT - CLEANING

1. General

- A. Prior to commencing the cleaning refer to 72-09-00 Cleaning for details of the cleaning processes referred to in Table 201.
- B. To ensure that all items within this breakdown that require cleaning and subsequent Inspection/Check are recognized, and identified by their Part Number, figures are provided which equate with the Illustrated Parts Catalogue (I.P.C.). Thus, Fig.201 Item 10 equates with the relevant Figure and Item Number in the same breakdown in the I.P.C. Items illustrated in the I.P.C. which are not illustrated in this breakdown, are those items which are either discarded at overhaul, or are normally assembled to another item and are only called up by number.
- C. As all items requiring cleaning are illustrated in the figures, Table 201 does not list all items, but deals collectively with the items requiring the same cleaning process.
- D. On receipt of the items from disassembly, all protective blanks, covers etc. deemed necessary for the protection of the items will have been assembled and, in addition, many of the items will arrive in containers. Any special containers, blanks, covers etc. are listed in Table 202 by their Tool Ref. No. (Tool 123). For the manufacturer's Part No. refer to the appropriate Table in Special Tools, Fixtures and Equipment Section.

2. Cleaning Components

CAUTION: BEFORE USING HEAVY CLEANING PROCESSES J, L AND N, INVESTIGATE ALL REPAIRS CARRIED OUT ON EACH COMPONENT TO IDENTIFY THOSE HAVING PLASMA SPRAY COATINGS. THE NITRIC ACID USED IN PROCESSES J, L AND N WILL ATTACK THE ALUMINIUM CONTENT OF SOME TYPES OF COATING, MAKING REPLACEMENT OF THE COATING NECESSARY.

- A. All blanks, covers etc. must be removed from the items prior to cleaning and reassembled immediately afterwards. Items received in special cleaning containers should remain therein during the cleaning procedures unless otherwise stated.

**OLYMPUS 593**

MK.610-14-28

OVERHAUL

- B. All items contained in this breakdown must be cleaned by the appropriate processes quoted in the table, to achieve a cleanliness to enable the Inspection/Check to be carried out correctly. Where alternative processes are quoted, the operator must decide what process to use depending on the amount of contamination of the item. Any item that is not cleaned satisfactorily must be recleaned by the appropriate process.
- C. When an assembly item has attached parts that have certain protective finishes e.g. silver plating, the cleaning process for the assembly item may damage the finish of the part. To minimize the effect on the finish of the part, reduce the process immersion time to a minimum. If the finish is damaged, then the damaged finish will have to be replaced or reconditioned.
- D. Certain components are subject to Controlled Manufacturing Technique (CMT) procedures. The cleaning of these components is critical and variations from the specified cleaning procedures and solutions are prohibited without approval from the engine manufacturer. All components to which this applies are identified as such in the Remarks column of the Cleaning Processes Table.

HP TURBINE NOZZLES - CLEANING

1. General

- A. Prior to commencing the cleaning refer to 72-09-00 Cleaning for details of the cleaning processes referred to in Table 201.
- B. To ensure that all items within this breakdown that require cleaning and subsequent Inspection/Check are recognized, and identified by their Part Number, figures are provided which equate with the Illustrated Parts Catalogue (I.P.C.). Thus, Fig.201 Item 10 equates with the relevant Figure and Item Number in the same breakdown in the I.P.C. Items illustrated in the I.P.C. which are not illustrated in this breakdown, are those items which are either discarded at overhaul, or are normally assembled to another item and are only called up by number.
- C. As all items requiring cleaning are illustrated in the figures, Table 201 does not list all items, but deals collectively with the items requiring the same cleaning process.
- D. On receipt of the items from disassembly, all protective blanks, covers etc. deemed necessary for the protection of the items will have been assembled and, in addition, many of the items will arrive in containers. Any special containers, blanks, covers etc. are listed in Table 202 by their Tool Ref. No. (Tool 123). For the manufacturer's Part No. refer to the appropriate Table in Special Tools, Fixtures and Equipment Section.

2. Cleaning Components

CAUTION: BEFORE USING HEAVY CLEANING PROCESSES J, L AND N, INVESTIGATE ALL REPAIRS CARRIED OUT ON EACH COMPONENT TO IDENTIFY THOSE HAVING PLASMA SPRAY COATINGS. THE NITRIC ACID USED IN PROCESSES J, L AND N WILL ATTACK THE ALUMINIUM CONTENT OF SOME TYPES OF COATING, MAKING REPLACEMENT OF THE COATING NECESSARY.

- A. All blanks, covers etc. must be removed from the items prior to cleaning and reassembled immediately afterwards. Items received in special cleaning containers should remain therein during the cleaning procedures unless otherwise stated.

HP TURBINE ROTOR, HUB AND LABYRINTH ASSEMBLIES - CLEANING

1. General

- A. Prior to commencing the cleaning refer to 72-09-00
Cleaning for details of the cleaning processes referred
to in Table 201.
- B. To ensure that all items within this breakdown that
require cleaning and subsequent Inspection/Check are
recognized, and identified by their Part Number, figures
are provided which equate with the Illustrated Parts
Catalogue (I.P.C.). Thus, Fig.201 Item 10 equates with
the relevant Figure and Item Number in the same breakdown
in the I.P.C. Items illustrated in the I.P.C. which are
not illustrated in this breakdown, are those items which
are either discarded at overhaul, or are normally assembled
to another item and are only called up by number.
- C. As all items requiring cleaning are illustrated in the
figures, Table 201 does not list all items, but deals
collectively with the items requiring the same cleaning
process.
- D. On receipt of the items from disassembly, all protective
blanks, covers etc. deemed necessary for the protection
of the items will have been assembled and, in addition,
many of the items will arrive in containers. Any special
containers, blanks, covers etc. are listed in Table 202
by their Tool Ref. No. (Tool 123). For the manufacturer's
Part No. refer to the appropriate Table in Special Tools,
Fixtures and Equipment Section.

2. Cleaning Components

CAUTION: BEFORE USING HEAVY CLEANING PROCESSES J, L AND N,
INVESTIGATE ALL REPAIRS CARRIED OUT ON EACH COM-
PONENT TO IDENTIFY THOSE HAVING PLASMA SPRAY
COATINGS. THE NITRIC ACID USED IN PROCESSES J, L
AND N WILL ATTACK THE ALUMINIUM CONTENT OF SOME
TYPES OF COATING, MAKING REPLACEMENT OF THE COATING
NECESSARY.

- A. All blanks, covers etc. must be removed from the items
prior to cleaning and reassembled immediately afterwards.
Items received in special cleaning containers should remain
therein during the cleaning procedures unless otherwise
stated.

LP TURBINE BEARING SUPPORT - CLEANING

1. General

- A. Prior to commencing the cleaning refer to 72-09-00 Cleaning for details of the cleaning processes referred to in Table 201.
- B. To ensure that all items within this breakdown that require cleaning and subsequent Inspection/Check are recognized, and identified by their Part Number, figures are provided which equate with the Illustrated Parts Catalogue (I.P.C.). Thus, Fig.201 Item 10 equates with the relevant Figure and Item Number in the same breakdown in the I.P.C. Items illustrated in the I.P.C. which are not illustrated in this breakdown, are those items which are either discarded at overhaul, or are normally assembled to another item and are only called up by number.
- C. As all items requiring cleaning are illustrated in the figures, Table 201 does not list all items, but deals collectively with the items requiring the same cleaning process.
- D. On receipt of the items from disassembly, all protective blanks, covers etc. deemed necessary for the protection of the items will have been assembled and, in addition, many of the items will arrive in containers. Any special containers, blanks, covers etc. are listed in Table 202 by their Tool Ref. No. (Tool 123). For the manufacturer's Part No. refer to the appropriate Table in Special Tools, Fixtures and Equipment Section.

2. Cleaning Components

- A. All blanks, covers etc. must be removed from the items prior to cleaning and reassembled immediately afterwards. Items received in special cleaning containers should remain therein during the cleaning procedures unless otherwise stated.
- B. All items contained in this breakdown must be cleaned by the appropriate processes quoted in the table, to achieve a cleanliness to enable the Inspection/Check to be carried out correctly. Where alternative processes are quoted, the operator must decide what process to use depending on the amount of contamination of the item. Any item that is not cleaned satisfactorily must be recleaned by the appropriate process.

- C. When an assembly item has attached parts that have certain protective finishes e.g. silver plating, the cleaning process for the assembly item may damage the finish of the part. To minimize the effect on the finish of the part, reduce the process immersion time to a minimum. If the finish is damaged, then the damaged finish will have to be replaced or reconditioned.
- D. Certain components are subject to Controlled Manufacturing Technique (CMT) procedures. The cleaning of these components is critical and variations from the specified cleaning procedures and solutions are prohibited without approval from the engine manufacturer. All components to which this applies are identified as such in the Remarks column of the Cleaning Processes Table.

OVERHAUL

TURBINE EXHAUST DIFFUSER ASSEMBLY - CLEANING

1. General

- A. Prior to commencing the cleaning refer to 72-09-00 Cleaning for details of the cleaning processes referred to in Table 201.
- B. To ensure that all items within this breakdown that require cleaning and subsequent Inspection/Check are recognized, and identified by their Part Number, figures are provided which equate with the Illustrated Parts Catalogue (I.P.C.). Thus, Fig.201 Item 10 equates with the relevant Figure and Item Number in the same breakdown in the I.P.C. Items illustrated in the I.P.C. which are not illustrated in this breakdown, are those items which are either discarded at overhaul, or are normally assembled to another item and are only called up by number.
- C. As all items requiring cleaning are illustrated in the figures, Table 201 does not list all items, but deals collectively with the items requiring the same cleaning process. The PNC pitot and reheat pressure detector connector cleaning is detailed in 76-13-03.
- D. On receipt of the items from disassembly, all protective blanks, covers etc. deemed necessary for the protection of the items will have been assembled and, in addition, many of the items will arrive in containers. Any special containers, blanks, covers etc. are listed in Table 202 by their Tool Ref. No. (Tool 123). For the manufacturer's Part No. refer to the appropriate Table in Special Tools, Fixtures and Equipment Section.

2. Cleaning Components

CAUTION: BEFORE USING HEAVY CLEANING PROCESSES J, L AND N, INVESTIGATE ALL REPAIRS CARRIED OUT ON EACH COMPONENT TO IDENTIFY THOSE HAVING PLASMA SPRAY COATINGS. THE NITRIC ACID USED IN PROCESSES J, L AND N WILL ATTACK THE ALUMINIUM CONTENT OF SOME TYPES OF COATING, MAKING REPLACEMENT OF THE COATING NECESSARY.

- A. All blanks, covers etc. must be removed from the items prior to cleaning and reassembled immediately afterwards. Items received in special cleaning containers should remain therein during the cleaning procedures unless otherwise stated.

SPHERICAL JOINT FLANGE - CLEANING

1. General

- A. Prior to commencing the cleaning refer to 72-09-00
Cleaning for details of the cleaning processes referred
to in Table 201.
- B. To ensure that all items within this breakdown that
require cleaning and subsequent Inspection/Check are
recognized, and identified by their Part Number, figures
are provided which equate with the Illustrated Parts
Catalogue (I.P.C.). Thus, Fig.201 Item 10 equates with
the relevant Figure and Item Number in the same breakdown
in the I.P.C. Items illustrated in the I.P.C. which are
not illustrated in this breakdown, are those items which
are either discarded at overhaul, or are normally assembled
to another item and are only called up by number.
- C. As all items requiring cleaning are illustrated in the
figures, Table 201 does not list all items, but deals
collectively with the items requiring the same cleaning
process.
- D. On receipt of the items from disassembly, all protective
blanks, covers etc. deemed necessary for the protection
of the items will have been assembled and, in addition,
many of the items will arrive in containers. Any special
containers, blanks, covers etc. are listed in Table 202
by their Tool Ref. No. (Tool 123). For the manufacturer's
Part No. refer to the appropriate Table in Special Tools,
Fixtures and Equipment Section.

2. Cleaning Components

CAUTION: BEFORE USING HEAVY CLEANING PROCESSES J, L AND N,
INVESTIGATE ALL REPAIRS CARRIED OUT ON EACH COM-
PONENT TO IDENTIFY THOSE HAVING PLASMA SPRAY
COATINGS. THE NITRIC ACID USED IN PROCESSES J, L
AND N WILL ATTACK THE ALUMINIUM CONTENT OF SOME
TYPES OF COATING, MAKING REPLACEMENT OF THE COATING
NECESSARY.

- A. All blanks, covers etc. must be removed from the items
prior to cleaning and reassembled immediately afterwards.
Items received in special cleaning containers should remain
therein during the cleaning procedures unless otherwise
stated.

CLEANING

OVERHAUL

- B. All items contained in this breakdown must be cleaned by the appropriate processes quoted in the table, to achieve a cleanliness to enable the Inspection/Check to be carried out correctly. Where alternative processes are quoted, the operator must decide what process to use depending on the amount of contamination of the item. Any item that is not cleaned satisfactorily must be recleaned by the appropriate process.
- C. When an assembly item has attached parts that have certain protective finishes e.g. silver plating, the cleaning process for the assembly item may damage the finish of the part. To minimize the effect on the finish of the part, reduce the process immersion time to a minimum. If the finish is damaged, then the damaged finish will have to be replaced or reconditioned.
- D. Certain components are subject to Controlled Manufacturing Technique (CMT) procedures. The cleaning of these components is critical and variations from the specified cleaning procedures and solutions are prohibited without approval from the engine manufacturer. All components to which this applies are identified as such in the Remarks column of the Cleaning Processes Table.

OVERHAUL

- B. All items contained in this breakdown must be cleaned by the appropriate processes quoted in the table, to achieve a cleanliness to enable the Inspection/Check to be carried out correctly. Where alternative processes are quoted, the operator must decide what process to use depending on the amount of contamination of the item. Any item that is not cleaned satisfactorily must be recleaned by the appropriate process.
- C. When an assembly item has attached parts that have certain protective finishes e.g. silver plating, the cleaning process for the assembly item may damage the finish of the part. To minimize the effect on the finish of the part, reduce the process immersion time to a minimum. If the finish is damaged, then the damaged finish will have to be replaced or reconditioned.
- D. Certain components are subject to Controlled Manufacturing Technique (CMT) procedures. The cleaning of these components is critical and variations from the specified cleaning procedures and solutions are prohibited without approval from the engine manufacturer. All components to which this applies are identified as such in the Remarks column of the Cleaning Processes Table.

MAIN DRIVES ACCESSORY GEARBOX (LEFT-HAND) - CLEANING

1. General

- A. Prior to commencing the cleaning refer to 72-09-00 Cleaning for details of the cleaning processes referred to in Table 201.
- B. To ensure that all items within this breakdown that require cleaning and subsequent Inspection/Check are recognized, and identified by their Part Number, figures are provided which equate with the Illustrated Parts Catalogue (I.P.C.). Thus, Fig.201 Item 10 equates with the relevant Figure and Item Number in the same breakdown in the I.P.C. Items illustrated in the I.P.C. which are not illustrated in this breakdown, are those items which are either discarded at overhaul, or are normally assembled to another item and are only called up by number.
- C. As all items requiring cleaning are illustrated in the figures, Table 201 does not list all items, but deals collectively with the items requiring the same cleaning process.
- D. On receipt of the items from disassembly, all protective blanks, covers etc. deemed necessary for the protection of the items will have been assembled and, in addition, many of the items will arrive in containers. Any special containers, blanks, covers etc. are listed in Table 202 by their Tool Ref. No. (Tool 123). For the manufacturer's Part No. refer to the appropriate Table in Special Tools, Fixtures and Equipment Section.

2. Cleaning Components

- A. All blanks, covers etc. must be removed from the items prior to cleaning and reassembled immediately afterwards. Items received in special cleaning containers should remain therein during the cleaning procedures unless otherwise stated.
- B. All items contained in this breakdown must be cleaned by the appropriate processes quoted in the table, to achieve a cleanliness to enable the Inspection/Check to be carried out correctly. Where alternative processes are quoted, the operator must decide what process to use depending on the amount of contamination of the item. Any item that is not cleaned satisfactorily must be recleaned by the appropriate process.

ACCESSORY GEARBOX CASE ASSEMBLY (RIGHT-HAND) - CLEANING

1. General

- A. Prior to commencing the cleaning refer to 72-09-00 Cleaning for details of the cleaning processes referred to in Table 201.
- B. To ensure that all items within this breakdown that require cleaning and subsequent Inspection/Check are recognized, and identified by their Part Number, figures are provided which equate with the Illustrated Parts Catalogue (I.P.C.). Thus, Fig.201 Item 10 equates with the relevant Figure and Item Number in the same breakdown in the I.P.C. Items illustrated in the I.P.C. which are not illustrated in this breakdown, are those items which are either discarded at overhaul, or are normally assembled to another item and are only called up by number.
- C. As all items requiring cleaning are illustrated in the figures, Table 201 does not list all items, but deals collectively with the items requiring the same cleaning process.
- D. On receipt of the items from disassembly, all protective blanks, covers etc. deemed necessary for the protection of the items will have been assembled and, in addition, many of the items will arrive in containers. Any special containers, blanks, covers etc. are listed in Table 202 by their Tool Ref. No. (Tool 123). For the manufacturer's Part No. refer to the appropriate Table in Special Tools, Fixtures and Equipment Section.
- E. Many parts of the accessory gearbox contain asbestos, refer to DISASSEMBLY 72-09-00 for part identification and details of safety precautions to be followed when handling these parts.

2. Cleaning Components

- A. All blanks, covers etc. must be removed from the items prior to cleaning and reassembled immediately afterwards. Items received in special cleaning containers should remain therein during the cleaning procedures unless otherwise stated.

MAIN DRIVES - CLEANING

1. General

- A. Prior to commencing the cleaning refer to 72-09-00 Cleaning for details of the cleaning processes referred to in Table 201.
- B. To ensure that all items within this breakdown that require cleaning and subsequent Inspection/Check are recognized, and identified by their Part Number, figures are provided which equate with the Illustrated Parts Catalogue (I.P.C.). Thus, Fig.201 Item 10 equates with the relevant Figure and Item Number in the same breakdown in the I.P.C. Items illustrated in the I.P.C. which are not illustrated in this breakdown, are those items which are either discarded at overhaul, or are normally assembled to another item and are only called up by number.
- C. As all items requiring cleaning are illustrated in the figures, Table 201 does not list all items, but deals collectively with the items requiring the same cleaning process.
- D. On receipt of the items from disassembly, all protective blanks, covers etc. deemed necessary for the protection of the items will have been assembled and, in addition, many of the items will arrive in containers. Any special containers, blanks, covers etc. are listed in Table 202 by their Tool Ref. No. (Tool 123). For the manufacturer's Part No. refer to the appropriate Table in Special Tools, Fixtures and Equipment Section.

2. Cleaning Components

- A. All blanks, covers etc. must be removed from the items prior to cleaning and reassembled immediately afterwards. Items received in special cleaning containers should remain therein during the cleaning procedures unless otherwise stated.
- B. All items contained in this breakdown must be cleaned by the appropriate processes quoted in the table, to achieve a cleanliness to enable the Inspection/Check to be carried out correctly. Where alternative processes are quoted, the operator must decide what process to use depending on the amount of contamination of the item. Any item that is not cleaned satisfactorily must be recleaned by the appropriate process.

AIR STARTER DRIVE AND IDG DRIVE - CLEANING

1. General

- A. Prior to commencing the cleaning refer to 72-09-00 Cleaning for details of the cleaning processes referred to in Table 201.
- B. To ensure that all items within this breakdown that require cleaning and subsequent Inspection/Check are recognized, and identified by their Part Number, figures are provided which equate with the Illustrated Parts Catalogue (I.P.C.). Thus, Fig.201 Item 10 equates with the relevant Figure and Item Number in the same breakdown in the I.P.C. Items illustrated in the I.P.C. which are not illustrated in this breakdown, are those items which are either discarded at overhaul, or are normally assembled to another item and are only called up by number.
- C. As all items requiring cleaning are illustrated in the figures, Table 201 does not list all items, but deals collectively with the items requiring the same cleaning process.
- D. On receipt of the items from disassembly, all protective blanks, covers etc. deemed necessary for the protection of the items will have been assembled and, in addition, many of the items will arrive in containers. Any special containers, blanks, covers etc. are listed in Table 202 by their Tool Ref. No. (Tool 123). For the manufacturer's Part No. refer to the appropriate Table in Special Tools, Fixtures and Equipment Section.

2. Cleaning Components

- A. All blanks, covers etc. must be removed from the items prior to cleaning and reassembled immediately afterwards. Items received in special cleaning containers should remain therein during the cleaning procedures unless otherwise stated.
- B. All items contained in this breakdown must be cleaned by the appropriate processes quoted in the table, to achieve a cleanliness to enable the Inspection/Check to be carried out correctly. Where alternative processes are quoted, the operator must decide what process to use depending on the amount of contamination of the item. Any item that is not cleaned satisfactorily must be recleaned by the appropriate process.

- C. When an assembly item has attached parts that have certain protective finishes e.g. silver plating, the cleaning process for the assembly item may damage the finish of the part. To minimize the effect on the finish of the part, reduce the process immersion time to a minimum. If the finish is damaged, then the damaged finish will have to be replaced or reconditioned.
- D. Certain components are subject to Controlled Manufacturing Technique (CMT) procedures. The cleaning of these components is critical and variations from the specified cleaning procedures and solutions are prohibited without approval from the engine manufacturer. All components to which this applies are identified as such in the Remarks column of the Cleaning Processes Table.

SCAVENGE OIL PUMP DRIVE AND IDLER GEAR - CLEANING

1. General

- A. Prior to commencing the cleaning refer to 72-09-00 Cleaning for details of the cleaning processes referred to in Table 201.
- B. To ensure that all items within this breakdown that require cleaning and subsequent Inspection/Check are recognized, and identified by their Part Number, figures are provided which equate with the Illustrated Parts Catalogue (I.P.C.). Thus, Fig.201 Item 10 equates with the relevant Figure and Item Number in the same breakdown in the I.P.C. Items illustrated in the I.P.C. which are not illustrated in this breakdown, are those items which are either discarded at overhaul, or are normally assembled to another item and are only called up by number.
- C. As all items requiring cleaning are illustrated in the figures, Table 201 does not list all items, but deals collectively with the items requiring the same cleaning process.
- D. On receipt of the items from disassembly, all protective blanks, covers etc. deemed necessary for the protection of the items will have been assembled and, in addition, many of the items will arrive in containers. Any special containers, blanks, covers etc. are listed in Table 202 by their Tool Ref. No. (Tool 123). For the manufacturer's Part No. refer to the appropriate Table in Special Tools, Fixtures and Equipment Section.

2. Cleaning Components

- A. All blanks, covers etc. must be removed from the items prior to cleaning and reassembled immediately afterwards. Items received in special cleaning containers should remain therein during the cleaning procedures unless otherwise stated.
- B. All items contained in this breakdown must be cleaned by the appropriate processes quoted in the table, to achieve a cleanliness to enable the Inspection/Check to be carried out correctly. Where alternative processes are quoted, the operator must decide what process to use depending on the amount of contamination of the item. Any item that is not cleaned satisfactorily must be recleaned by the appropriate process.

DRIVE, PULSE PROBE AND HOUSING - CLEANING

1. General

- A. Prior to commencing the cleaning refer to 72-09-00
Cleaning for details of the cleaning processes referred
to in Table 201.
- B. To ensure that all items within this breakdown that
require cleaning and subsequent Inspection/Check are
recognized, and identified by their Part Number, figures
are provided which equate with the Illustrated Parts
Catalogue (I.P.C.). Thus, Fig.201 Item 10 equates with
the relevant Figure and Item Number in the same breakdown
in the I.P.C. Items illustrated in the I.P.C. which are
not illustrated in this breakdown, are those items which
are either discarded at overhaul, or are normally assembled
to another item and are only called up by number.
- C. As all items requiring cleaning are illustrated in the
figures, Table 201 does not list all items, but deals
collectively with the items requiring the same cleaning
process.
- D. On receipt of the items from disassembly, all protective
blanks, covers etc. deemed necessary for the protection
of the items will have been assembled and, in addition,
many of the items will arrive in containers. Any special
containers, blanks, covers etc. are listed in Table 202
by their Tool Ref. No. (Tool 123). For the manufacturer's
Part No. refer to the appropriate Table in Special Tools,
Fixtures and Equipment Section.

2. Cleaning Components

- A. All blanks, covers etc. must be removed from the items
prior to cleaning and reassembled immediately afterwards.
Items received in special cleaning containers should remain
therein during the cleaning procedures unless otherwise
stated.
- B. All items contained in this breakdown must be cleaned by
the appropriate processes quoted in the table, to achieve
a cleanliness to enable the Inspection/Check to be carried
out correctly. Where alternative processes are quoted,
the operator must decide what process to use depending on
the amount of contamination of the item. Any item that is
not cleaned satisfactorily must be recleaned by the
appropriate process.

CONCORDE

OLYMPUS 593 OVERHAUL MANUAL

TEMPORARY REVISION 72-578

Insert in 72-65-00 facing page 201

REASON FOR ISSUE

Oil filters - cleaning LHR only (DDA A373/7)

ACTION

Procedure to be used for cleaning Olympus 593 oil filters at LHR.

P/N's B420159 or B489886

and B485947* outer) form an assembly together but should
B485954 inner) be stored seperately.

B493131 or inner) form an assembly together but should

B471714 inner) be stored seperately.

B473874 outer)

Refer to I.P.C. 72-65-00 Fig.2

1. Disassemble filters.
2. Clean all filters EXCEPT B485947 in Ardrox 1854 solution.
Clean for sufficient time to remove carbon and lacquer.
(Use Process spec. BEA No. 43).

NOTE: B485947* MUST be cleaned in Ardrox 690
(Use Process spec. BEA No.121)

3. Heavy cold water rinse.
4. De-water and protect with Ardrox 3961 or applied 8-15.
5. Store in plastic bags.

NOTE: Filters must not be stored as an assembly but stored
seperately. Springs, where fitted are also stored
seperately.

MAIN OIL PUMP - CLEANING

1. General

- A. Prior to commencing the cleaning refer to 72-09-00 Cleaning for details of the cleaning processes referred to in Table 201.
- B. To ensure that all items within this breakdown that require cleaning and subsequent Inspection/Check are recognized, and identified by their Part Number, figures are provided which equate with the Illustrated Parts Catalogue (I.P.C.). Thus, Fig.201 Item 10 equates with the relevant Figure and Item Number in the same breakdown in the I.P.C. Items illustrated in the I.P.C. which are not illustrated in this breakdown, are those items which are either discarded at overhaul, or are normally assembled to another item and are only called up by number.
- C. As all items requiring cleaning are illustrated in the figures, Table 201 does not list all items, but deals collectively with the items requiring the same cleaning process.
- D. On receipt of the items from disassembly, all protective blanks, covers etc. deemed necessary for the protection of the items will have been assembled and, in addition, many of the items will arrive in containers. Any special containers, blanks, covers etc. are listed in Table 202 by their Tool Ref. No. (Tool 123). For the manufacturer's Part No. refer to the appropriate Table in Special Tools, Fixtures and Equipment Section.

2. Cleaning Components

- A. All blanks, covers etc. must be removed from the items prior to cleaning and reassembled immediately afterwards. Items received in special cleaning containers should remain therein during the cleaning procedures unless otherwise stated.
- B. All items contained in this breakdown must be cleaned by the appropriate processes quoted in the table, to achieve a cleanliness to enable the Inspection/Check to be carried out correctly. Where alternative processes are quoted, the operator must decide what process to use depending on the amount of contamination of the item. Any item that is not cleaned satisfactorily must be recleaned by the appropriate process.

ENGINE - DISASSEMBLY

1. General

- WARNING:** IF CONTAMINATION OF THE ENGINE BY DANGEROUS SUBSTANCES IS SUSPECTED, HEALTH AND SAFETY PRECAUTIONS MUST BE OBSERVED. THAT IS, DISASSEMBLY OF THE ENGINE MUST BE CARRIED OUT IN A CONTROLLED ENVIRONMENT WITH AIR EXTRACTION/FILTRATION AND PERSONNEL WEARING SUITABLE PROTECTIVE CLOTHING/APPARATUS.
- A. Prior to commencing the disassembly, refer to 72-09-00 Disassembly for general information.
 - B. Throughout the text special tools are quoted by their Ref.No. e.g. (Tool 1234). For a complete list of tooling required for the disassembly and for the Manufacturers Part No., refer to Special Tools, Fixtures and Equipment Table 1001.
 - C. The procedures detailing the receipt, inspection, oil and fuel draining, the installation of the power plant in the disassembly stand and the removal of all harnesses, tubing and accessories (including the left and right-hand gearboxes), are contained in 71-00-00 Disassembly.
 - D. This chapter details the procedures for disassembling the bare engine into a number of sub-assemblies, which are assembled to mobile stands or pallets ready for transfer to their disassembly sections.
 - E. Sub-assemblies are removed in sequence starting from the top (rear) of the engine. In some instances more than one sub-assembly is removed at a time, as the HP compressor diffuser assembly/combustion section/HP turbine bearing support and nozzles, and the HP compressor assembly/intermediate case assembly.
 - F. The tooling required for removing the HP compressor assembly and the LP compressor assembly, will depend on whether the assemblies require check balancing. Though the tooling is different, the sequence for removing the assemblies is the same whether they require balancing or not.

2. Disassemble the Bare Engine to its Sub-assemblies

A. Remove the Turbine Exhaust Diffuser (Ref.Fig.101).

- (1) Set the sliding weights of a steelyard scale (Ashworth Ross, two ton capacity) to 1250 lb (544,3 kg). Attach the scale to a hoist then raise the hoist and attach the lifting equipment (Tool 1973) to the steelyard scale. Ensure the securing blocks, attached to each lifting hook are secured in their uppermost position.

- (2) Raise the hoist and position the lifting equipment above the exhaust diffuser then remove the protector from the rear (top) of the diffuser. Locate vanes 3, 7 and 9 of the diffuser. Vanes are numbered in a clockwise direction viewed from the rear with vanes 10 and 1 at the TOP position. The TOP position can be determined by the engine rear lifting bracket on the C.C.O.C. rear flange.
- (3) Carefully lower the hoist and engage the hooks of the lifting equipment, from the inward curved side of the vane, beneath their respective vanes. Slide the securing blocks downward to engage the top of the vane then tighten the wingnuts to secure the blocks in position.
- (4) Unscrew and remove the bolts and washers securing the rear covers to the C.C.O.C. heat shields then withdraw or lower the covers to provide access to the C.C.O.C. rear flange. Release and remove the turbine blade containment shield mounting brackets. Remove nuts and any associated brackets from the C.C.O.C./exhaust diffuser flange.

NOTE: Before attempting to raise the exhaust diffuser ensure the hoist is correctly aligned to provide a vertical lift.

- (5) Carefully raise the hoist to balance the steelyard scales. With the flanges of the C.C.O.C. and exhaust diffuser separated continue to raise the hoist until the assembly is clear of the LP drive shaft.

NOTE: Instantaneous snatch loadings up to a maximum of 2000 lb (907,2 kg) in order to separate the turbine exhaust diffuser from the combustion chamber, are acceptable.

- (6) With the diffuser support (Tool 1230) positioned on a pallet traverse the hoist and lower the diffuser to rest on the support. Release the hooks of the lifting equipment from the vanes and remove the lifting equipment.
- (7) Place the protector (Tool 437) on the rear flange of the diffuser and secure with the protector clamps.
- (8) Transfer the turbine exhaust diffuser to its disassembly section (72-53-00 Disassembly).

OVERHAUL

B. Remove the LP Signal Shaft System Generating Mechanism (Ref.Fig.102).

- (1) Place the two halves of the protector (Tool 1138) around the LP turbine hub labyrinth and secure with its knurled screws.
- (2) Release the keywashers from the locking piece retaining nut and the outer guide retaining nut.
- (3) Lower the immobilizer (Tool 927) onto the centralizing fixture (Tool 1261) engaging the holes over the studs, and secure with the fixture washers and nuts. Ensure that the two thumbscrews of the immobilizer are unscrewed, and the two sliding dogs withdrawn.
- (4) Attach a hoist to the lifting plate of the immobilizer, then position and lower the centralizing fixture over the LP drive shaft and engage the location pins and studs in the C.C.O.C. flange. Screw the thumbnuts onto the fixture studs and fully tighten. Disconnect the hoist from the immobilizer.
- (5) Turn the LP drive shaft and align the cutaways in the shaft with the dogs in the immobilizer. Engage the immobilizer dogs in the cutaways in the shaft and secure the dogs by tightening the thumbscrews. Engage the spanner wrench (Tool 1513) in the retaining nut (Ref.Fig.102 operation 1), then unscrew the nut. Remove the spanner, then withdraw the retaining nut, keywasher and locking piece.
- (6) Engage the spanner wrench (Tool 1617) in the plain round nut securing the inner guide (operation 2), then unscrew the nut. Remove the spanner, then withdraw the retaining nut.
- (7) If the adapter (Tool 1300) is not assembled to the multiplier (1022), locate the adapter on the multiplier, align the holes, then insert the adapter bolts through the adapter and screw them into the multiplier. Fully tighten the bolts.
- (8) Insert the spanner wrench (Tool 929) into the immobilizer and engage the spanner in the outer guide retaining nut (operation 3). Lower the adapter/multiplier onto the immobilizer, turning the multiplier drive (if necessary) to engage the adapter dogs in the immobilizer, and the multiplier drive in the spanner. Engage the wrench handle (Tool 1651) in the multiplier, then unscrew the nut.

- (9) Withdraw the handle, multiplier/adaptor and the spanner from the immobilizer. Release the thumbnuts and withdraw the dogs from the LP drive shaft, then remove the nuts and washers securing the centralizing fixture to the immobilizer. Lift the immobilizer from the centralizing fixture and LP drive shaft and place on a suitable surface.
- (10) Withdraw the outer guide retaining nut, then withdraw the inner/outer guide/helical spline nut/keywasher as a unit, followed by the adjusting washer. Separate the items and place them in container (Tool 1378).
- C. Remove the LP Turbine Hub and Bearing Retaining Nuts (Ref.Fig.103).
- (1) Release the cupwasher from the LP turbine hub retaining nut.
- (2) Locate the immobilizer (Tool 862) in the end of the LP drive shaft engaging the splines of the immobilizer in those of the shaft, and resting the immobilizer plate on the end of the shaft.
- (3) Slide the spanner wrench (Tool 1578) over the immobilizer and engage the spanner in the turbine hub retaining nut (operation 1).
- (4) Attach a suitable strop and hoist to the torque multiplier (Tool 1647), then position and lower the multiplier onto the immobilizer/wrench turning the drive of the multiplier (if necessary) until it is engaged in both items. Release the hoist and strop.
- (5) Engage the wrench handle (Tool 1651) in the multiplier, then turn the handle counter-clockwise to unscrew the nut.
- (6) When the nut is loose, withdraw the immobilizer and continue unscrewing the nut using the wrench. Withdraw the wrench, then remove the retaining nut and cupwasher from the LP drive shaft.
- (7) Slide the spanner wrench (Tool 1616) over the immobilizer and engage the spanner in the bearing retaining nut (operation 2).
- (8) Position and lower the multiplier (Tool 1647) onto the immobilizer/wrench turning the drive of the multiplier (if necessary) until it engages in both items.

OVERHAUL

- (9) Engage the wrench handle (Tool 1651) in the multiplier, then turn the handle counter-clockwise to unscrew the nut.
- (10) When the nut is loose, withdraw the immobilizer and continue unscrewing the nut using the wrench. Withdraw the wrench and spanner, then remove the nut.
- (11) Lower the immobilizer (Tool 927) over the LP drive shaft and onto the centralizing fixture (Tool 1261), engaging the holes over the studs and secure with the fixture washers and nuts. Remove the nuts and washers securing the centralizing fixture to the C.C.O.C. Connect a hoist to the lifting plate of the immobilizer, then raise the centralizing fixture clear of the LP drive shaft. Position and lower the fixture onto a suitable surface, disconnect the hoist, then release and remove the immobilizer from the centralizing fixture.
- (12) If the disassembly is not to be continued immediately, place the protector (Tool 1180) on the rear flange of the C.C.O.C. and secure the protector with its bolts, washers and nuts.

D. Remove the LP Turbine Hub and Wheel (Ref.Fig.104).

- (1) If assembled, release and remove the protector from the C.C.O.C. rear flange. Unscrew the tommy bar of the lifting/extracting fixture (Tool 1142) to withdraw the inner housing. Lower the fixture over the LP drive shaft and engage the internal thread of the fixture with the hub thread. Screw the fixture onto the hub until the thread is fully engaged, then screw in on tommy bar and engage the fixture housing with the LP drive shaft.
- (2) Attach a hoist to the lifting link of the fixture, then screw in on the tommy bar to draw the hub off the drive shaft. When the hub is released, raise the hoist and guide the hub off the shaft. Place the two halves of the protector (Tool 1134) around the front (bottom) labyrinth and secure with the knurled screws. Place the (wooden) support (Tool 1012) on the pallet (Tool 1014), then position and lower the LP turbine onto the support. Disconnect the hoist, then unscrew and remove the fixture from the hub.

OVERHAUL

- (3) Withdraw the LP turbine adjusting washer from the LP shaft then assemble the two halves of the steady (Tool 1013) around the HP turbine rear labyrinth and the LP drive shaft and secure with the two slave screws.
- (4) Transfer the LP turbine hub and wheel to its disassembly section (72-52-02 Disassembly).
- E. Remove the LP Turbine Nozzle (Ref.Fig.105).
- (1) Unscrew and remove the two bolts securing each of the two cover plates/flanged sealing bars to the mounting bosses on the bottom left-hand side of the C.C.O.C. near the rear flange, then remove the cover and withdraw the sealing bar.
- (2) Ensure that the knurled nuts of the multiple leg sling (Tool 1192) are released and that the hooks are pushed downwards with the tommy bars pointing inwards. Attach a hoist to the lifting ring, then position the sling over the nozzle. Ensuring that the hooks pass in between the vanes, lower the sling until the stops rest on the diaphragm.
- (3) Turn the tommy bars to the left to position the retaining hooks under the vanes, then pull up on the hooks and lock with the knurled nuts. Steadily raise the nozzle until clear of the engine, then position and lower onto a suitable pallet. Release the hoist, but do not release the sling (at this stage) otherwise the vanes will fall out of the diaphragm.
- (4) Place the two halves of the protector (Tool 1061) around the rear labyrinth of the HP turbine and secure with the knurled screws (Ref.Fig.106).
- (5) Transfer the LP turbine nozzle to its disassembly section (72-52-01 Disassembly).
- F. Remove the HP Turbine Wheel (Ref.Fig.106 and 107).
- (1) Position the immobilizer (Tool 1354) across the C.C.O.C. rear flange, engaging the spring plunger in one of the HP turbine rear labyrinth air holes, and securing the ends of the immobilizer to the C.C.O.C. flange with slave nuts, washers and bolts. Release the HP turbine hub/disk/labyrinth nuts in the sequence of No.1, 6, 3, 8, 2, 7, 4, 9, 5 and 10 using the

cranked spanner wrench (Tool 1630), then remove the nuts. Release and remove the immobilizer from the C.C.O.C. flange.

- (2) Ensure that the thrust bolts of the mechanical puller (Tool 1247) are unscrewed, and that the tommy bars of the hooked bolts are pointing to 'FREE'. Release and remove the split steady from the HP rear labyrinth and LP drive shaft.
- (3) Lower the mechanical puller over the LP drive shaft and locate the hooked bolts in the air holes of the rear labyrinth. Turn the tommy bar of each hooked bolt to the 'LOCK' position, then screw down on the thrust bolts until they contact the HP turbine disk. Screw in on the thrust bolts in equal progressive increments until the labyrinth is released. Remove the labyrinth/puller and place on a suitable surface. Turn the tommy bars of the hooked bolts to the 'FREE' position, then withdraw the puller from the labyrinth.
- (4) Ensure that the knurled nuts of the lifting fixture (Tool 1120) are unscrewed, and the tommy bars of the claws are pointing to 'UNLOCK'. Attach a hoist to the ring of the lifting fixture, then position and lower the fixture over the LP drive shaft and guide the fixture into the disk until the flange of the top location ring rests on the disk. Turn the tommy bars of the claws to the 'LOCK' position engaging the claws under the disk, then tighten the knurled nuts to lock the claws (Ref.Fig.107).
- (5) Taking care to guide the disk, raise the wheel clear of the LP drive shaft. Place the (wooden) support (Tool 979) on the pallet (Tool 1014), then position and lower the HP turbine wheel onto the support.
- (6) Release the knurled nuts of the fixture, then turn the claw tommy bars to the 'UNLOCK' position. Raise the hoist and guide the fixture out of the disk. Lower the fixture onto a suitable surface and release the hoist.
- (7) Assemble the two halves of the sleeve (Tool 1058) in between the LP and HP drive shafts and secure with the two slave screws.
- (8) Transfer the HP turbine wheel to its disassembly section (72-51-03 Disassembly).

G. Remove the HP Turbine Hub Retaining Nut (Ref.Fig.108).

(1) Release the HP turbine hub retaining nut cupwasher.

(2) Assemble the torque multiplier and adapters to the immobilizer.

NOTE: This instruction is only applicable if the items have been separated.

- (a) Locate the multiplier (Norbar Model No.10-25 to 1) on the pillar side of the adapter plate (Tool 106), align the holes in both items, then insert the cap screws into the plate and screw them into the multiplier. Fully tighten the bolts. Position the lifting plate on the pillars then insert the screws through the pillars and plate and screw them into the tapped side of the pillars.
 - (b) Locate the multiplier/adapter on the handle end of the immobilizer (Tool 105) engaging the keys in the slots. Assemble a washer to each of the two bolts, then insert the bolts into the adapter plate and screw them into the immobilizer. Fully tighten the bolts.
 - (c) Locate the adapter (Tool 1315) on the flanged end of the immobilizer, and engage it on the dowels with the Hirth serrations facing away from the immobilizer. Insert the immobilizer cap screws into the adapter and screw them into the tapped holes in the immobilizer. Fully tighten the screws.
- (3) Lower the spanner wrench (Tool 107) over the LP drive shaft and engage it in the nut. Attach a hoist to the lifting plate of the multiplier, then position and lower the tool over the spanner. Align the Hirth serrations on the tool with the Hirth serrations and bolts of the hub, then lower the tool over the bolts until it abuts the spanner. Turn the drive of the multiplier (if required) to engage it with the spanner, then continue lowering the tool until the Hirth serrations engage and abut. Screw slave nuts onto the hub bolts and fully tighten the nuts. Release the hoist, then release and remove the lifting plate from the pillars of the adapter plate.

DISASSEMBLY

OLYMPUS 593

MK.610-14-28
OVERHAUL

- (4) Use a torque measuring wrench (20 to 600 lbf ft. (30 to 800 N.m)) and unscrew the hub nut ensuring that the torque used is not greater than 12500 lbf ft. (16950 N.m) (500 lbf ft. (678 N.m) registering on the wrench gauge because of the 25 to 1 multiplier). If the nut is not released at 12500 lbf ft. (16950 N.m), the nut must be drilled off (Ref.para.(6)).
- (5) Remove the torque wrench, then assemble the lifting plate to the pillars of the adapter plate and secure the plate with bolts. Attach a hoist to the lifting plate, then release and remove the slave nuts from the hub bolts. Raise the hoist until the tool is clear, then position and lower onto a suitable surface and release the hoist. Withdraw the spanner from the LP drive shaft, then remove the hub nut, washer and keywasher (if released).
- (6) If the hub nut was not released and is still assembled, proceed as follows (Ref.Fig.108).
- (a) Prepare a suitable drill gun and hardened drill of 0.125 in. (3 mm) diameter. Assemble a suitable collar to the drill and secure it to give a dimension of 1.500 in. (38 mm) from the tip of the drill to the face of the collar.
 - (b) Lower the drilling jig (Tool 1297) over the LP drive shaft and insert the three location fingers in between the keywasher and the slots in the nut. Ensure that the jig is correctly assembled abutting the nut. Drill through the hub nut using the nine guide holes.
 - (c) On completion of the drilling, remove the drill jig, then remove all swarf. Remove the hub nut from the shaft by whatever method is suitable, dependent on the result of the drilling. The nut may be loosened by a drift and hammer and unscrewed by hand, or it may be necessary to assemble the spanner, multiplier and adapter and proceed as detailed in para.(3) to (5).

H. Remove the HP Turbine Hub (Ref.Fig.109).

- (1) Release and remove the split sleeve (Tool 1058) from the LP and HP drive shaft.

- (2) Unscrew the tommy bar to retract the cylinder of the lifting/extracting fixture (Tool 1057), then attach a hoist to the lifting handle of the fixture. Position and lower the fixture over the LP drive shaft and engage the hub bolts in the pillars and holes in the fixtures plate. With the fixture plate abutting the hub, screw slave nuts onto the hub bolts and fully tighten the nuts. Release the hoist then screw in the tommy bar and engage the fixture cylinder in the HP drive shaft.
- (3) Attach the hoist to the lifting handle, then screw in on the tommy bar and draw the hub off the HP drive shaft. With the hub released, raise the hoist and guide the hub off the shafts. Open the protector (Tool 1063) and position it around the hub outer labyrinth, then secure the protector with the retaining screw. Position the two halves of the protector (Tool 1062) around the inner series of labyrinths, then secure the protector with the two retaining screws. Position and lower the hub onto a suitable surface, then remove the slave nuts and withdraw the fixture. Lower the fixture onto a suitable surface and disconnect the hoist.
- (4) Withdraw the adjusting washer from the HP drive shaft, then lower the guide sleeve (Tool 1202) over the LP drive shaft and position it on the HP drive shaft. If the disassembly is not to be continued immediately, place the protector (Tool 1180) on the rear flange of the C.C.O.C. and secure the protector with its bolts, washers and nuts.

J. Remove the Compressor Diffuser/Combustion Chamber Outer Case Assembly (Ref.Fig.110).

- (1) Release the wire-locking from the bolts securing the HP compressor stage 7 bolted vanes on the exit guide blade case, then remove the eight rear (top) bolts and sleeves from the case.
- (2) Release the wire-locking from the HP compressor stage 7 blank plug assemblies in the probe mounting block, then remove the plugs from the block. Release and remove the bolts securing the mounting block and remove the block.

- (3) If the lifting fixture (Tool 1310) is not assembled to the adapter ring (Tool 1183), position the lifting fixture on the adapter ring, interpose the fixture spacers between the two and secure the two together with the fixture bolts, washers and nuts.
- (4) Release and remove the protector (Tool 1180) (if assembled), from the rear of the C.C.O.C. Attach a hoist to the lifting eye of the fixture, then raise the hoist, position and lower the fixture onto the C.C.O.C., aligning the dowel hole in the adapter plate with the dowel on the C.C.O.C. rear flange, and guiding the plate bolts into the C.C.O.C. flange. Assemble adapter washers and nuts to the bolts, and fully tighten the nuts.
- (5) Using the extension bar (Tool 1974) and socket release and remove the nuts, bolts and brackets from the diffuser case/HP compressor unit guide blade case flanges, then evenly dispose and insert the four guide pins (Tool 1304) into the diffuser/exist guide blade flanges.
- (6) Raise the hoist and guide the C.C.O.C./diffuser off the HP compressor case and clear of the LP drive shaft. Remove the guide pins from the diffuser flange, then position and lower the C.C.O.C./diffuser onto the pallet (Tool 1661). Remove the nuts and washers securing the adapter plate to the C.C.O.C. flange, then remove the lifting equipment/adapter from the C.C.O.C., lower onto a suitable surface and disconnect the hoist. Remove the guide sleeve from the HP drive shaft. If the disassembly of the engine is not to continue immediately, lower the protector (Tool 1237) over the HP drive shaft and secure the protector to the HP compressor flange.
- (7) Remove the knurled nuts from the protector (Tool 1180), lower the protector onto the C.C.O.C. flange guiding the studs through the flange bolt-holes, then screw the nuts onto the studs.
- (8) Transfer the compressor diffuser/combustion chamber outer casing to the disassembly section (72-00-51 Disassembly).

K. Remove the LP Signal Shaft Tube (Ref.Fig.111A).

- (1) Locate the extractor (Tool 3165) onto the LP drive shaft and screw onto the end of the LP signal shaft tube.
- (2) Operate the hand pump to release the LP signal shaft tube.
- (3) Unscrew and remove the extractor (Tool 3165).
- (4) Screw the lifting fixture (Tool 1323) onto the end of the LP signal shaft tube, then attach a hoist to the fixture.
- (5) Raise the hoist sufficient to enable the halves of the split sleeve (Tool 609) to be inserted in the LP drive shaft and around the signal tube. Carefully raise the tube until it is clear of the LP drive shaft, then position and lower it into its fixture (Tool 1452). Unscrew and remove the fixture from the tube.
- (6) Transfer the LP signal shaft tube to its disassembly section (72-31-04 Disassembly).

NOTE : Should the HP compressor rotor require a check balance proceed to para.L. For normal engine disassembly proceed to para.M.

L. Assemble Slave Bearing Inner Track to HP Drive Shaft (Ref.Fig.112).

- (1) Remove engine bearing inner track from HP drive shaft.
 - (a) Ensure the three extraction claws (Tool 1979) are assembled to the mechanical puller (Tool 1019) and the hydraulic cylinder is assembled between the two triangular plates (Ref.Fig.111).
 - (b) Using a hoist raise and position the puller above the LP drive shaft. Ensure each extraction claw is withdrawn then lower the puller and screw the end fitting fully onto the HP shaft.
 - (c) Adjust the puller and align the claws with the recesses under the bearing inner track, screw in the claws and lock by tightening the locknuts.

- (d) Connect the feed pipe from a hand operated hydraulic pump to the hydraulic cylinder then operate the pump until the track is released. Withdraw the extraction claws, disconnect the feed pipe from the hydraulic cylinder then release and remove the puller. Remove and identify the bearing inner track.
- (2) Assemble slave bearing (Tool 248) inner track to HP drive shaft.
 - (a) Ensure the three extraction claws of the puller (Tool 1019) are fully withdrawn, locked in position and the hydraulic cylinder is assembled above the top plate (Ref.detail C).
 - (b) Using a hoist raise and position the puller above the LP drive shaft. Position the slave bearing inner track on the HP drive shaft. Lower the puller and screw the end fitting fully onto the HP shaft. Adjust the length of the puller until the extraction claw mounting flange is located on the bearing track.
 - (c) Connect the hand operated hydraulic pump to the hydraulic cylinder. Operate the pump until the bearing track is pressed fully into position on the HP shaft. Disconnect the hydraulic pump release and remove the puller.
 - (d) Assemble the split sleeves (Tool 1058) between the HP and LP drive shafts.

M. Unlock the LP Drive Shaft (Ref.Fig.112).

CAUTION: FAILURE TO CORRECTLY POSITION THE LP DRIVE SHAFT
MAY ENTAIL DAMAGE TO THE BEARING FAILURE PROBE.

- (1) Turn the LP drive shaft to position its master spline at the engine (normal) top vertical centre line position.

NOTE: The static LP bearing failure probe is located in the oil distributor block assembly, positioned in the inner case of the intermediate case in line with No.2 vane (60 deg from the top vertical position on the right-hand side). The probe operating ring on the LP rotor shaft rear has a grooved lug which is aligned with the master spline on the LP rotor and drive shaft. The probe ring (normally) rotates around the probe, and to ensure that the lug does not strike the probe (and damage it), during any movement of the LP rotor, drive shaft or intermediate case, the master splines must be correctly positioned.

- (2) Slide the setting pointer (Tool 973) over the LP drive shaft and engage the locating pin in the master spline of the shaft.

OVERHAUL

- (3) Attach a hoist to the slave locking tube (Tool 579), then position and lower the tube into the LP drive shaft until the tube flange is (approx.) 7 in. (180 mm) from the end of the shaft. Release and open the split sleeve (Tool 980), then position it around the slave tube and resting on the split sleeve in the shaft. Secure the sleeve with its swing bolt and knurled nut. Lower the slave tube onto the split sleeve, then disconnect the hoist from the tube.
- (4) Release and open the lifting fixture (Tool 981), then position it around the LP drive shaft in between the two shoulders on the shaft. Close the fixture and secure it with the swing bolt and star knob. Attach a spring balance (Salter 0-400 lb) to the hoist, then attach the lifting hook of the fixture to the spring balance.
- (5) Raise the hoist until the weight of the shaft is taken by a loading of 200-lb (90 kg) on the spring balance. Take the weight of the slave tube, then release and remove the split sleeve (Tool 980) supporting it. Ensuring that the 'LOCKED' mark on the tube is in line with the setting pointer (Tool 973), lower the slave tube and feed the splines on the (lower) end of the slave tube through the splines in the LP drive shaft, turning the tube slightly (if required), to engage the splines of both items. Lower the tube further (ensuring that it is not turned) and engage the splines on the slave tube with the spherical mounting, turning the tube slightly (if necessary) to engage the two. The (bottom) end of the shaft will now be resting on the rotor shaft rear, with the smaller flange at the top of the tube (approx.) in line with the split sleeves in the LP drive shaft.

NOTE: The weight of the LP drive shaft is taken to enable the spherical mounting to be turned.

- (6) Turn the slave tube 45 deg to align the 'UNLOCKED' mark on the tube with the setting pointer (Tool 973).

NOTE: The turning of the tube turns the spherical mounting aligning its lands with the cut-away in the LP drive shaft, which will allow the withdrawal of the shaft.

OLYMPUS 593

MK.610-14-28

OVERHAUL

- (7) Raise the slave tube (approx.) 1.50 in. (38 mm) (ensuring that it is not turned), to disengage the tube from the spherical mounting, then turn the tube back 45 deg to align the 'LOCKED' mark (and the master spline) on the tube with the setting pointer (and the drive shaft master spline). Lift the tube up, turning the tube slightly (if necessary) and engage the splines of the tube and drive shaft, then raise the shaft sufficiently to enable the split sleeve (Tool 980) to be assembled. Position the sleeve around the slave tube and secure the sleeve with its swing bolt and knurled nut, then rest the tube on the sleeve.
- (8) Lower the hoist sufficient to disconnect the spring balance from the hoist then lower both spring balance and lifting equipment to rest. Connect the hoist to the lifting ring of the slave tube, then carefully raise the tube until clear of the drive shaft. Position and lower the slave tube into its container (Tool 580), then disconnect the hoist from the tube. Release and remove the split sleeve from the slave tube, then withdraw the split sleeve and setting pointer from the LP drive shaft.
- (9) Connect the spring balance to the hoist and ensure that the lifting equipment is attached to the balance. Raise the hoist sufficient to enable the split sleeve (Tool 402) to be assembled, ensuring that a loading of 200 lb (90 kg) (as indicated on the scale) is not exceeded. Insert the split sleeve into the end of the HP drive shaft, then lower the LP drive shaft and rest it on the sleeve. Release and remove the lifting equipment from the LP drive shaft, then disconnect the equipment from the balance and the balance from the hoist. If the LP drive shaft will not lift up under the loading of 200 lb (90 kg), the shaft must still be partially locked. Use the slave tube and ensure that the master spline of the spherical mounting is offset by 45 deg from the master spline of the LP drive shaft, using the tooling in the manner previously quoted to check the following.
 - (a) Lower the slave tube and engage in the splines at the bottom of the LP drive shaft.
 - (b) Check the position of the tube relative to the setting pointer, then lower the tube to disengage it from the shaft. Turn the tube 45 deg and engage it in the spherical mounting, turning the tube as necessary to engage.

DISASSEMBLY

72-00-00

Page 127

OLYMPUS 593

MK.610-14-28

sneema

OVERHAUL

- (c) Turn the tube as required to set the spherical mounting 45 deg from the position noted when the tube was engaged in the shaft.
- (d) Ensuring that the tube is not turned, withdraw the tube from the spherical mounting, turn it back 45 deg and draw it through the drive shaft splines. The spherical mounting and LP drive shaft are now aligned for disengagement.

N. Assemble the Lifting Equipment to the HP Compressor Assembly.

NOTE: Though there is only one method of removal, the tooling to be assembled for removal is dependent on whether the assembly requires a check balance of the rotating assembly or whether it is to be disassembled in the normal manner. The procedure for both tooling arrangements are detailed under their own titles as follows.

- (1) Release and remove the protector (Tool 1237) (if assembled), from the rear of the HP compressor.
- (2) Prepare and assemble the (normal) lifting equipment to the HP compressor assembly (Ref.Fig.113).
 - (a) Release and remove the HP compressor rear (No.12) labyrinth from the HP drive shaft.
 - (i) Release and remove the nuts, keywashers and flat washers from the rear (top) bolts securing the labyrinth to the HP drive shaft, then unscrew and remove the nuts using the cranked ring wrench (Tool 1574) from the front bolts (hidden under the labyrinth), securing the labyrinth to the shaft.
 - (ii) On engines Pre.SB.0L.72-8305-154, screw pullers (Tool 1668) into the tapped extractor holes in the rear (top) of the labyrinth until they contact the HP drive shaft flange, then screw in the pullers in equal progressive increments until the labyrinth is released.

DISASSEMBLY

- (v) Remove the retaining rings from the eight bolts in the HP drive shaft labyrinth securing flange then remove the bolts.
- (b) Attach the lifting plate of the beam type sling (Tool 1051) to a hoist, then position the hoist over the adapter (Tool 1041). Secure the two whips of the sling to the two lifting plates of the adapter with shackles.
- (c) Raise the hoist and position the adapter over the LP drive shaft. Lower the adapter aligning the bolt holes in both flanges, and locate the adapter pin hole over the HP compressor case locating pin. Insert the adapter slave bolts through the case flange and secure with (special) slave nuts. Fully tighten the nuts. Release the sling from the adapter, then remove the sling from the hoist.
- (d) Lower the spacer sleeve (Tool 391) over the LP drive shaft and screw it onto the HP drive shaft. Screw the slave nut (Tool 1042) onto the LP drive shaft and just tighten against the sleeve.
- (e) Lower the lifting fixture (Tool 1043) over the slave nut and screw the fixture onto the extension sleeve until tight. Attach a hoist to the lifting fixture.
- (3) Assemble the lifting/balancing equipment to the HP compressor assembly (Ref.Fig.114).
 - (a) Ensure that the slave bearing (Tool 248) (outer race and rollers) is assembled in the rear (smaller dia.) end of the rear bearing adapter (Tool 1028) and is secured with the adapter ring. Position the multiple leg sling (Tool 1054) on the rear flange of the adapter, and screw the three captive knurled screws of the sling into the tapped holes in the adapter. Connect a hoist to the lifting ring of the sling.
 - (b) Ensure that the three rollers have been drawn outwards, then raise and position the adapter over the LP drive shaft. Insert a part of the balancing drive belt (129 x 3 in.) into the cut-away part of the adapter, then lower the adapter ensuring that the belt goes around the LP drive shaft. Align the adapter lifting ring with

OVERHAUL

sneema

the (normal) top position of the engine, then continue lowering the adapter aligning the bolt-holes in both flanges, and engaging the locating pin in the HP compressor case flange with the hole in the adapter. Insert the adapter slave bolts through the case flange and secure with (special) slave nuts. Fully tighten the nuts. Release the sling from the adapter, then remove the sling from the hoist.

- (c) Lower the spacer sleeve (Tool 389) over the LP drive shaft and screw it onto the HP drive shaft. Screw the slave nut (Tool 1042) onto the LP drive shaft and just tighten against the sleeve.
- (d) Lower the lifting fixture (Tool 1043) over the slave nut and screw the fixture onto the extension sleeve until tight. Attach a hoist to the lifting fixture.

P. Remove the HP Compressor/Intermediate Case Assembly.

NOTE: View through the lightening holes in the spacer sleeve (Tool 389) surrounding the LP drive shaft rear (top) end, and ensure that the master spline of the shaft is in line with the top position of the LP and HP cases and remains in that position during the removal procedure.

- (1) Ensure that the clamps of the mobile stand (Tool 1036) are drawn outwards. If the assembly is not to be balanced, position the lifting fixture (Tool 1039) in the stand with the lifting plate underneath and the lifting plate pad (at the TOP position), located in the small cut-away in the centre of the brake side of the stand (Ref.Fig.116). Remove the nuts and washers from the studs of the fixture.
- (2) Using the extension bar (Tool 1974) and socket release and remove the nuts, bolts and brackets from the LP compressor case rear flange/exit guide vane case front flange, the exit guide vane case rear flange/intermediate case front flange and the exit guide vane case split line flanges. At the exit guide vane case rear flange/intermediate case front flange bolt positions 31, 32, 33 and 34, check bolt protrusion through nuts before slackening. Note bolts with less than 1.5 thread pitches showing beyond nut chamfer and discard them when removed (Ref.SB.72-8404-234).

OLYMPUS 593

MK.610-14-28
OVERHAUL

sneema

- (3) Take the weight of the HP compressor assembly on the hoist, then carefully withdraw the top unit guide vane case half. Insert three slave packing pieces (Tool 1200 (2 off) and 1201 (1 off)) (evenly disposed) in place of the case, and loosely hold each piece in place with four nuts and bolts (Ref.Fig.116). Turn the bottom exit guide vane case to clear the gearbox mounting adapters attached to the intermediate case, then withdraw the case. Position and secure three more slave packing pieces (Tool 1200 (2 off) and 1201 (1 off)). Lower the hoist and fully tighten the slave packing piece nuts.
- (4) Screw in on the jacking wheel of the build/strip base (Tool 1244) and raise the jacking pad until it contacts the LP compressor rotor and supports it.
- (5) Unscrew and remove the outer ring of (24) bolts securing the split sealing ring/outer labyrinth housing/bearing housing to the intermediate outer case, using the ratchet wrench (Tool 1569). Remove the split sealing ring when released.
- (6) Unscrew the inner ring of (30) bolts securing the outer labyrinth/front inner air baffle/bearing housing to the intermediate inner case, using the cranked ratchet wrench (Tool 1541), until the bolts are released from the intermediate case anchor nuts, then lower the captive bolts.
- (7) Examine the location of the outer ring of bolt-holes and identify three equi-spaced lugs, each with three holes. Screw a standard 1/4 28-UNF bolt (approx 0.750 in. long) into the vacant extractor hole in each lug.
- (8) Remove the nuts and bolts securing the top of the slave packing pieces to the intermediate case flange.
- (9) Take the weight of the HP compressor/intermediate case on the hoist, then very slowly raise the hoist directly upwards and at the same time screw in the three extractor bolts in equal progressive increments to separate the LP compressor bearing housing assembly from the intermediate case. As the hoist is raised, ensure that the extractor bolts keep in pace, otherwise the LP compressor rotor may be lifted, or alternatively the bearing housing/labyrinth housing may be bowed by the extractor bolts. If the separation of the bearing housing from the intermediate case is not

DISASSEMBLY

72-00-00

Page 134

Jun 30/01

OLYMPUS 593

MK.610-14-28
OVERHAUL

even, the extraction bolts are bowing the housing and the LP compressor rotor is being lifted, the locating pins and oil transfer tube (between the LP compressor and intermediate case) are binding. This will be due to the hoist being off centre, causing a slight tilt or sideways movement. Lower the hoist, check and re-adjust the position of the hoist to ensure a direct upward lift of the HP compressor, then slowly raise the hoist and ensure that it is a straight lift by comparing the clearance between the intermediate case bottom flange and the slave packing pieces. Continue the separation until the bearing housing is clear of the intermediate inner case, and the inner case locating pins are withdrawn from the bearing housing.

- (10) Steadily raise the hoist until the intermediate case is clear of the LP compressor, then position the hoist over the mobile stand (Tool 1036). Unscrew the jacking wheel of the support steady (Tool 396), then locate the support pot over the end of the LP drive shaft in the bottom of the intermediate inner case (Ref.Fig.116). Position the steady pin hole over the locating pin and screw the captive bolts into the inner case. Screw in on the jacking wheel until the support pot abuts the LP drive shaft.
- (11) Position and lower the intermediate case onto the lifting fixture in the mobile stand, aligning the top of the case with the 'TOP' of the fixture (at the lifting plate pad), and locating the fixture studs in the bolt-holes in the case flange (Ref.Fig.115). Assemble the slave washers and nuts to the fixture studs and fully tighten the nuts. Position the stand clamps over the case flange, then secure the clamps with their knurled nuts. Release the hoist from the lifting fixture.

NOTE: If the assembly is to be balanced, the lifting fixture will not be assembled to the mobile stand and the text relating to it ignored.

- (12) Release and remove the slave packing pieces from the rear (uppermost) flange of the LP compressor case, then unscrew and remove the three slave jacking bolts from the bearing/labyrinth housing. Remove the bolt and retaining plate securing the oil transfer tube, then withdraw the oil tube from the bearing housing. If the disassembly is not to continue immediately, place the protector (Tool 1227) on the rear flange of the LP compressor and secure the protector with its bolts, washers and nuts.

OVERHAUL

(13) Transfer the HP compressor/intermediate case assembly to its disassembly section (72-33-00 Disassembly).

Q. Assemble the Lifting Equipment to the LP Compressor Assembly (Ref.Fig.117).

NOTE: Though there is only one method of removal, the tooling to be assembled for removal is dependent on whether the assembly requires a check balance of the rotating assembly, or whether it is to be disassembled in the normal manner. The procedure for both tooling arrangements are detailed under their own titles as follows.

(1) Assemble the (normal) lifting equipment to the LP compressor assembly.

NOTE: If the rear bearing adapter (Tool 1011) is used, a slave bearing assembly (part of the tool) may be bolted to the bottom of the adapter, which must be unbolted and removed before using the adapter.

NOTE: As an alternative to the method quoted for assembling the adapter, the slave exit guide vane case may be assembled to the adapter, then the joint tool assembled to the LP compressor.

- (a) Position the lifting fixture (Tool 1096) on top of the rear bearing adapter (Tool 344 or 1011), align the offset bolt-hole, then screw the fixtures captive bolts into the adapter. Release and remove the access panels from the adapter.
- (b) Release and remove the protector (Tool 1227) (if assembled) from the rear of the LP compressor. Attach a hoist to the lifting plate of the fixture, then position and lower the adapter over the LP compressor bearing housing, leaving (approx) 0.200 in. (5 mm) between the housing and adapter. Align the inner ring of captive bolts in the bearing housing with the captive nuts in the adapter, then engage 10 of the bolts with the nuts, and screw the nuts onto the bolts until the slack of the bolts is taken up. Do not fully tighten the bolts.

- (c) Slide the 'TOP' half of the slave exit guide vane (E.G.V.) case (Tool 398), identified by the lifting eye, in between the adapter and the LP case at the (normal) top position of the LP case. Engage the screwed alignment pin of the E.G.V. case in the pin hole in the LP case and assemble slave nuts and bolts to the LP and E.G.V. case flanges.
 - (d) Slide the 'BOTTOM' half of the slave E.G.V. case in between the adapter and the LP case and abut the TOP E.G.V. case. Assemble slave nuts and bolts (Tool 559) to the abutment flanges of the E.G.V. cases, and to the LP and E.G.V. case flanges. Remove the access panels from the E.G.V. cases.
 - (e) Align the screwed alignment pin in the adapter with the pin hole in the top position of the E.G.V. TOP case, then lower the adapter onto the slave E.G.V. cases and the bearing housing. Insert the adapter slave bolts into the E.G.V. cases and tighten the adapter captive nuts. Fully tighten the E.G.V. abutment flange nuts and the E.G.V./LP case flange nuts. Fully tighten the bearing housing/adapter nuts and bolts. Replace and secure the access panels to the E.G.V. case and adapter.
- NOTE: If the adapter will not abut the E.G.V. case or the bearing housing, screw in or out on the jacking wheel of the build/strip base as necessary to abut the items.
- (2) Assemble the lifting/balancing equipment to the LP compressor assembly.
 - (a) Release and remove the protector (Tool 1227) (if assembled) from the rear of the LP compressor.
 - (b) Release and remove the operating ring from the LP compressor rotor shaft rear (Ref.Fig.118).

OVERHAUL

- (i) Release the cupwasher from the operating ring retaining nut, then position and lower the immobiliser (Tool 1330) into the LP rotor shaft rear engaging the splines of both items.

NOTE: Before using the multiplier (Tool 1333), turn the input drive and note the direction of rotation of the output drive.

- (ii) Lower the spanner wrench (Tool 325) onto the retaining nut, then lower the multiplier (Tool 1333) onto the spanner, turning the multiplier drive (if necessary) to enable it to engage its drive in the immobiliser and its capscrews into the holes in the spanner.
 - (iii) Engage the wrench handle (Tool 1651) in the multiplier, then unscrew the (right-hand) retaining nut until released, taking into account the direction of rotation of the multiplier output drive.
 - (iv) Remove the handle, multiplier, spanner and immobiliser from the rotor shaft rear, then remove the retaining nut, cupwasher and operating probe ring.
- (c) Release and remove the LP compressor rear bearing assembly (Ref.Fig.118 and 119).
 - (i) Release the cupwasher from the bearing/bevel gear retaining nut, then insert the sleeve (Tool 696) into the LP rotor shaft rear. Lower the immobilizer (Tool 280) into the LP shaft and engage the splines of both items.
 - (ii) If the multiplier (Tool 1022) is not assembled to the spanner wrench (Tool 1594), position the multiplier on the spanner, insert the spanner slave bolts through the spanner and screw them into the multiplier. Fully tighten the bolts.

NOTE: Before using the multiplier (Tool 1022), turn the input drive and note the direction of rotation of the output drive.

OVERHAUL

- (iii) Lower the spanner/multiplier over the rotor shaft rear, and turn the multiplier drive (if necessary) to enable the multiplier to engage in the immobilizer and the spanner in the retaining nut.
- (iv) Engage the wrench handle (Tool 1651) in the multiplier, then release the (right-hand) retaining nut, taking into account the direction of rotation of the multiplier output drive. Withdraw the handle, multiplier/spanner and immobilizer from the rotor shaft rear, then use the hand spanner (Tool 1551) and unscrew the nut until released. Remove the spanner, then withdraw the nut, cupwasher, bevel gear and adjusting washer from the shaft.
- (v) Lower the mechanical puller (Tool 283) over the rotor shaft rear and locate the pressure pot over the shaft. Align the tapped holes in the plate with the inner ring of captive bolts in the bearing housing. Unscrew the large tommy bars of the puller (if required) to allow the puller plate to abut the housing, then screw 10 of the bearing housing bolts into the puller plate. With the small tommy bars held stationary, screw on the large tommy bars and draw the bearing off the rear rotor shaft until released. Unscrew the bearing housing bolts to release the puller, then withdraw the puller from the shaft/bearing housing.
- (vi) Withdraw the bearing housing assembly from the shaft, ensuring that the bearings (loose) inner race does not get displaced. Separate the two plates of the retainer (Tool 1198), then place a plate each side of the bearing. Locate the catch on one plate around the screw of the other plate, then tighten the knurled nut against the catch to secure the retainer to the bearing.

(vii) Withdraw the adjusting washer from the rotor shaft rear, measure its thickness, then select a spacer ring (Tool 345) (from the range), that is nearest to the dimension of the washer and lower the ring over the rotor shaft rear.

(d) Assemble the rear bearing adapter/slave bearing assembly to the LP compressor (Ref.Fig.120 and 121).

NOTE: If the rear bearing adapter (Tool 1011) is used, the slave bearing assembly will be part of the adapter and should be bolted to the bottom of the adapter, but if the rear bearing adapter (Tool 344) is used, the slave bearing assembly will be a separate tool (Tool 346). Whichever tooling is used, the method of assembling the rear bearing adapter, the slave bearing assembly and the slave exit guide vane case to the LP compressor can be carried out by various sequences, assembling all the items together before assembling them to the LP compressor, assembling them individually to the LP compressor, or by the method quoted hereafter.

(i) Ensure that the slave bearing assembly is assembled to the bottom of the rear bearing adapter (Tool 1011) and secured by bolts, or position the slave bearing assembly (Tool 346) on the bottom face of the rear bearing adapter (Tool 344), aligning the bearing captive bolts with the adapter captive nuts and screw the nuts onto the bolts. With the adapter the correct way up, position the lifting fixture (Tool 1096) on top of the adapter, align the offset bolt-hole, then screw the fixture captive bolts into the adapter. Attach a hoist to the lifting plate of the fixture.

Assembling Slave Bearing to LP Compressor
Rotor Shaft Rear
Figure 121

OLYMPUS 593

MK.610-14-28
OVERHAUL

- (ii) Ensure that the slave spacer ring (Tool 345) is assembled to the LP rotor shaft rear, then if adapter (Tool 1011) is being used, slide its spacer ring over the shaft. Position the rear bearing adapter/slave bearing over the rotor shaft rear, align the 'V' markings on the inside face of the bearings (if marked) with each other and the master spline on the shaft, then lower the adapter until the bearing is supported on the shaft. Remove the hoist, then release and remove the lifting fixture.
- (iii) Lower the mechanical driver (Tool 1099) (Ref.Fig.121) over the end of the rotor shaft rear, then screw the driver pad onto the threaded end of the shaft. Screw down on the large tommy bars, engage the driver pot with the bearing, then continue screwing and press the bearing onto the shaft until it abuts the slave ring. Unscrew and withdraw the driver from the shaft.
- (iv) Lower the packing piece (Tool 1100) onto the shaft (in lieu of the bevel gear and washer), then replace the engine cupwasher and screw on the retaining nut using the hand spanner (Tool 1551).
- (v) If the multiplier (Tool 1022) is not assembled to the spanner wrench (Tool 1594), position the multiplier on the spanner, insert the spanner slave bolts through the spanner and screw them into the multiplier (Ref.Fig.118). Fully tighten the bolts.

NOTE: Before using the multiplier (Tool 1022), turn the input drive and note the direction of rotation of the output drive.

- (vi) Lower the immobilizer (Tool 280) (Ref.Fig. 118) into the rotor shaft rear engaging the splines of both items, then lower the multiplier/spanner over the rotor shaft rear and turn the multiplier drive (if necessary) to enable the multiplier to engage in the immobilizer and the spanner in the retaining nut. Using the torque meter wrench (Tool 1658), torque-tighten the retaining nut between 650 and 700 lbf ft. (881 and 949 N.m) (26 to 28 lbf ft. (35,2 to 37,9 N.m) as indicated on the wrench because of the 25-1 multiplier), taking into account the direction of rotation of the multiplier output drive. Withdraw the wrench, multiplier/spanner and immobilizer from the shaft. Do not lock the retaining nut with its cupwasher.
- (vii) Screw in on the jacking wheel of the build/strip base to raise the LP compressor rotor (approx) 0.125 in. (3 mm). Slide the 'TOP' half of the slave exit guide vane (E.G.V.) case (Tool 398), identified by the lifting eye, in between the adapter and the LP case at the (normal) top position of the LP case. Engage the screwed alignment pin of the E.G.V. case in the pin hole in the LP case and assemble slave nuts and bolts to the LP and E.G.V. case flanges.
- (viii) Slide the 'BOTTOM' half of the slave E.G.V. case in between the adapter and the LP case and abut the 'TOP' E.G.V. case. Assemble slave nuts and bolts to the abutment flanges of the E.G.V. cases, and to the LP and E.G.V. case flanges. Align the screwed alignment pin in the adapter with the pin hole in the top position of the E.G.V. 'TOP' case, then lower the adapter until it abuts the E.G.V. cases by unscrewing the jacking wheel of the build/strip base. Insert the adapter slave bolts into the E.G.V. cases and tighten the adapter captive nuts. Fully tighten the E.G.V. abutment flange nuts and the E.G.V./LP case flange nuts.

MK.610-14-28
OVERHAUL

R. Remove the LP Compressor Assembly (Ref.Fig.122).

- (1) Ensure that the slave bearing (Tool 1288) is assembled to the front bearing adapter (Tool 588) and is secured by the bolted retaining plate. Position the adjustable support (Tool 1106) on the bottom of the adapter, then secure the support by screwing its captive bolts into the adapter. Release the support lock ring and unscrew the support pot. Invert the adapter and position it on the mobile stand (Tool 1105) with the adapter lifting eye positioned in the cut-away in the stand.
- (2) Release and remove the nuts, bolts and brackets from the LP compressor front flange/air inlet section rear flange.
- (3) Position the lifting fixture (Tool 1096) on top of the rear bearing adapter, align the offset bolt-hole, then screw the fixture captive bolts into the adapter. Connect a hoist to the fixture, then raise the LP compressor until clear of the air inlet section. Release and remove the jacking adapter (Tool 319) from the rotor shaft front, then position and lower the LP compressor onto the front bearing adapter in the mobile stand, ensuring that the lifting eyes on both adapters are in line. Secure the LP compressor to the adapter with the slave nuts and bolts of the adapter.
- (4) Screw in on the adjustable support until its pot contacts the LP compressor rotor, then tighten the lock ring. Disconnect the hoist from the lifting fixture.
- (5) Transfer the LP compressor assembly to its disassembly section (72-31-00 Disassembly).

S. Remove the Air Inlet Section.

- (1) Position the lifting fixture (Tool 1236) on the rear flange of the air inlet section and secure with engine bolts and nuts. Attach a hoist to the lifting plate of the fixture, then raise the air inlet section clear of the stand and position and lower onto a suitable pallet.
- (2) Disconnect the hoist, then release and remove the lifting fixture.
- (3) Transfer the air inlet section to its disassembly section (72-22-00 Disassembly).

OVERHAUL

TURBINE STATIC - DISASSEMBLY

1. General

- A. Prior to commencing disassembly, refer to 72-09-00 Disassembly for general information.
- B. Throughout the text special tools are quoted by their Ref.No. e.g. (Tool 1234). For a complete list of tooling required for the disassembly and for the Manufacturers Part No., refer to Special Tools, Fixtures and Equipment Table 1001.
- C. The turbine static sub-assembly is conveyed to the disassembly area on a transport pallet. A lifting fixture which also serves as a blank is secured to the rear flange of the combustion chamber outer case (C.C.O.C.). The sub-assembly is secured to a disassembly stand which can be rotated to facilitate access for removal of components. Pallets are used for the temporary storage and transportation of components.

2. Prepare to Disassemble Turbine Static Sub-assembly

A. Secure Sub-assembly to Disassembly Stand.

- (1) Ensure that the lifting fixture (Tool 1310) is securely bolted to the rear flange of the C.C.O.C.
- (2) Attach a crane hoist to the lifting fixture and assemble the sub-assembly to the disassembly stand (Tool). Secure the sub-assembly to the stand with slave nuts and bolts.

NOTE: Position the sub-assembly on the disassembly stand to ensure that when the sub-assembly is turned the internal pipes are suitably positioned for removal.

- (3) Remove the nuts and bolts securing the lifting fixture to the C.C.O.C. rear flange, then remove the lifting fixture and lower it onto a suitable container. Disconnect the hoist from the lifting fixture.

3. Disassemble Turbine Static Sub-assembly

A. Remove External Items from C.C.O.C. (Ref.Fig.101).

- (1) Remove the bolts securing the inspection port covers to the C.C.O.C., then remove the covers. On SB.72-8629-256 standard engines remove the spacer from the right-hand port location.
- (2) Unscrew the countersunk screws securing the brackets to the bottom and left-hand inspection port flanges, then remove the brackets and gaskets (SB.72-58).
- (3) Remove the bolts securing the optical pyrometer brackets and blanks to the C.C.O.C., then remove brackets and blanks.
- (4) Remove the bolts securing the fuel heater bracket to the C.C.O.C., then remove the bracket.
- (5) Unscrew and remove the engine igniter plugs and adjusting washers (Pre SB.74-1) from the C.C.O.C.

NOTE: On engines to SB.74-1 the adjusting washers will be released when the retaining plates are removed with the fuel sprayers.

- (6) Remove the bolts securing the pilot fuel sprayers, then withdraw the sprayers and remove the retaining clips (SB.74-1), gaskets (SB.72-58) and adjusting washers. Remove the transfer tube from the inside of each sprayer with the puller (Tool 416). Assemble protectors to each sprayer and place the transfer tubes and sprayers in containers.
- (7) Remove the nuts and bolts securing the heat insulation shield half-sections together. Remove the bolts, knitmesh cushion dampers and washers securing the heat shield to the brackets on the front flange of the C.C.O.C. then lift the heat shields away from the C.C.O.C.

B. Remove Main Fuel Sprayers from Diffuser Case (Ref.Fig.101).

CAUTION: EXERCISE GREAT CARE WHEN REMOVING SPRAYERS.
DO NOT APPLY FORCE TO THE TUBE SECTIONS.

- (1) Remove the bolts securing the brackets and sprayers to the diffuser case. Screw the puller (Tool 416) into the holes in each sprayer flange and remove the sprayers.

- (2) Protect the fuel inlet and outlet end of each sprayer with plastic protection caps to prevent ingress of foreign matter.
- (3) Place each sprayer in a thick plastic bag and store in tray (Tool 1429).
- C. Remove Air Duct from No.5 Vane of Diffuser Case (Ref. Fig.101).
- (1) Unscrew and remove the following tube locknuts.
- (a) Oil feed, using wrench spanner (Tool 1533).
 - (b) Oil scavenge, using wrench spanner (Tool 1540).
 - (c) Vent, using wrench spanner (Tool 1540).
- (2) Withdraw the locating plate from the three tube ends.
- (3) Using the cranked spanner (Tool 1583), release the bolts securing the air duct to the diffuser case, then remove the bolts, stiffener plates and brackets.
- (4) Withdraw the air duct from the diffuser case.
- D. Remove No.19 to 23 Labyrinth Housing from C.C.O.C. (Ref.Fig.102).
- (1) Remove the nuts securing the labyrinth housing and retaining plate to the HP nozzle vane support cone.
- (2) Screw pullers (Tool 137) into the tapped holes in the retaining plate and withdraw the plate. Remove the pullers.
- (3) Remove the nuts securing the housing to the shroud.
- (4) Screw pullers (Tool 137) into the threaded holes in the labyrinth housing and retaining plate. Remove the pullers, then place the housing in container (Tool 1415) and secure it with the clamps.
- (5) Remove the adjusting washer from the shroud.

E. Remove Combustion Chamber and Nozzle Vane Assembly from C.C.O.C.

- (1) Remove vane locking pins (Ref.Fig.103).
 - (a) If retention brackets are installed at nine locations at the top of the C.C.O.C. (Ref. SB.72-8725-269 and 72-8751-283) remove bolts and if installed, spacers, then detach the brackets.
 - (b) Remove bolts securing the locking pins to the C.C.O.C.
 - (c) Withdraw locking pins incorporating internal extraction threads with the impact puller, and those incorporating external threads with the impact puller and adapter (Tools 1653 and 859).
 - (d) Discard the locking pin securing bolts (Ref. SB.72-8648-215).
- (2) Remove the bolts securing the cover plate of the flanged sealing bar to the internal inspection port located between nozzle vane positions 14 and 15, then using the impact puller (Tool 1653) remove the sealing bar.
- (3) Check the engine mounting bracket bolt protrusion through nuts before slackening. Note bolts with less than 2.5 thread pitches showing beyond nut chamfer and discard them when removed (Ref.SB.72-8262-173). Remove the nuts, bolts and brackets securing the C.C.O.C. flange to the diffuser case flange.
- (4) Disassemble nozzle vane abutment segments from C.C.O.C. (Ref.Fig.103).
 - (a) Secure the multiple leg sling (Tool 1190) to the rear flange of the C.C.O.C.
 - (b) Attach the crane hoist to the sling then carefully lift the C.C.O.C. to allow access for the removal of the abutment segments.
 - (c) Remove the nuts, bolts and if installed, spacers retaining the abutment segments, then remove the segments from the C.C.O.C. Discard the abutment segment bolts (Ref. SB.72-8632-206).
 - (d) Lower the C.C.O.C. on to the diffuser case flange and remove the sling from the C.C.O.C. flange.
 - (e) Temporarily secure the C.C.O.C. to the diffuser case flange with nuts and bolts.

- (5) Withdraw the nozzle vane assembly and combustion chamber from the C.C.O.C. (Ref.Fig.104).
 - (a) Remove the nuts securing the nozzle vane support cone to the bearing support.
 - (b) Attach the sling (Tool 1645) to the multiple leg sling (Tool 1155), then using a crane hoist, raise the sling assembly and position it centrally over the nozzle vane support cone.
 - (c) Retract the sling legs and carefully lower the sling into the cone. Extend the legs into the support cone and lock the legs in position by inserting pins into the appropriate holes in the tool.
 - (d) Ensure that the lifting sling legs are correctly positioned in the support cone, then carefully raise the assembly clear of the bearing support. Assemble the protector (Tool 1945) Pre SB. standard SB.72-259, 72-264 or 72-282 combustion chamber or, (Tool 3131) SB.72-259, 72-264 or 72-282 combustion chamber, then place on a pallet (Tool 1014).
 - (e) Remove the lifting sling from the support cone.
 - (f) Remove the adjusting washer from the top of the bearing support in the C.C.O.C.
- F. Remove Support Cone and Nozzle Vanes from Combustion Chamber (Ref.Fig.104).
 - (1) Using the cranked ring wrench (Tool 1556), remove the bolts located inside the support cone. If the support cone is not loose, but is held in the combustion chamber, screw bolts (just removed) into the threaded extraction holes interposed between the bolt holes in the support cone until the cone is released, then remove the bolts.
 - (2) Assemble the multiple leg sling (Tool 1155) to the support cone then carefully lift the cone away from the combustion chamber and lower onto a pallet. Remove the sling from the support and hoist, then separate the slings.
 - (3) Remove the nozzle vanes spacing ring(s) pre-SB.72-64 and retaining ring from the combustion chamber, then withdraw the nozzle vanes from the combustion chamber and place into containers (Tool 1372).
 - (4) On engines to S.B.72-124 standard, remove the sealing strips from the nozzle vanes. Place the sealing strips in a clean polythene bag.

G. Remove Shroud and Insulation Blanket from Bearing Support (Ref Fig.105).

- (1) Remove the nuts securing the insulation blanket and shroud to the bearing support, then withdraw the insulation blanket and shroud from the support. Remove the oil transfer tube from the bearing support and store in a clean container.

H. Remove Air Duct Inner (Pre SB.72-8627-209) (Ref.Fig.105).

- (1) Rotate the stand to gain access to the front of the assembly.
- (2) Remove the six bolts Pre SB.72-81 or three bolts and three nuts SB.72-81 securing the air duct inner to the air duct outer, then withdraw the air duct inner.

NOTE: The inner air duct is not required for re-assembly as it is deleted by S.B.72-8627-209.

J. Remove No.12 Labyrinth Seal (Ref.Fig.105).

CAUTION: IT IS ESSENTIAL TO USE CORRECT SIZE SPANNER TO RELEASE NUTS. SHEARING OF SERRATIONS COULD OTHERWISE RESULT.

- (1) Remove the nut, then withdraw the eccentric locking items from each of the four bolts.
- (2) Release and remove the bolts and locking plates from the outer flange and the bolts from the inner flange. Withdraw the Labyrinth seal and adjusting washers and place the labyrinth seal in container (Tool 1416) securing it with the clamps.

K. Remove HP Turbine Bearing Oil Feed and Scavenge Tubes from Bearing Housing (Ref.Fig.106).

- (1) On engines to SB.72-8800-311 standard, remove the insulation blankets covering the tube unions.
- (2) Unscrew the union nut of each tube using the cranked wrench spanner (Tool 1552) for the feed tube and spanner (Tool 1546) for the scavenge tube.
- (3) Release the tube bush and clip assemblies from the brackets attached to No.5 vane duct, then withdraw the tubes from the vane. Blank the ends of the tubes.
- (4) Remove the insulation blankets from the tubes.

L. Remove HP Turbine Bearing Vent Tube and Cooling Tubes from Bearing Housing (Ref.Fig.106).

- (1) Remove the vent tube.
 - (a) Unscrew the flexible drain tube union nut using spanner (Tool 1181), then unscrew the vent tube union nut using spanner (Tool 1545).
 - (b) Release the tube bush and clip assembly from the bracket attached to No.5 vane duct, then withdraw the tube from No.5 vane. Blank the ends of the tubes.
 - (c) Release the straps and remove the insulation blankets from the tubes.
- (2) Remove the flexible drain tube union body and two washers Pre SB.72-82 or union body and washer SB.72-82 Part 1 from the branch tapping in the vent tube. Blank the union body tapping in the drain tube.
- (3) Remove the bolts and brackets from No.5 vane duct, then remove the bolts from No.6 vane duct.
- (4) Remove the cooling tubes.
 - (a) Remove the four bolts securing the air tubes elbow to No.3 vane duct, then disengage and remove the elbow from the tubes.
 - (b) Withdraw the tubes from the sub-assembly, then remove the two bolts and keywashers securing the cooling tubes to the retaining plate.
 - (c) Release the straps and remove the insulation blankets from the tubes.
- (5) Remove the spherical seal assembly and air duct outer.
 - (a) Remove the bolts securing the spherical seal housing and, if installed, the bracket SB.72-81 Pre SB.72-8627-209. Remove the housing and bracket from No.3 vane.
 - (b) Separate the spherical seal from the housing by removing the bolt and keywasher, then manipulate the seal until it can be withdrawn through the flanged end of the housing.

(c) Remove the air duct outer.

(6) Remove the shank nuts from the air duct outer (Ref. S.B.72-8627-209).

M. Remove Bearing Support from Diffuser Case (Ref.Fig.107).

(1) Rotate the stand until the bearing support is in a suitable position for removal.

CAUTION: ENSURE THAT BEARING SUPPORT IS ADEQUATELY SUPPORTED DURING REMOVAL PROCEDURE.

(2) Remove the nuts and bolts securing the bearing support air duct and diffuser case together, then carefully remove the bearing support from the diffuser case.

N. Remove Air Duct from Diffuser Case (Ref.Fig.107).

(1) Withdraw the (unsecured) couplings from No.3, 4, 5 and 6 vanes.

(2) Remove the nuts securing the couplings at No.1 and 4 vanes then withdraw the couplings.

(3) Withdraw the air duct from the diffuser case.

(4) Remove the seal rings from the couplings.

P. Remove Tube Fittings from Front Cover Unit (Ref.Fig.107).

(1) Remove the oil feed and scavenge tube end assemblies from the front cover unit.

(a) Unscrew the oil feed tube end assembly castellated nut using the cranked spanner (Tool 1598), then carefully withdraw the tube end assembly from the front cover unit.

(i) On engines to Pre SB.72-1 or SB.72-8800-311 standard, remove the filter assembly from the oil feed tube end assembly. Place the filter in a clean sealed container.

(ii) On engines to SB.72-1 or SB.72-39 standard, unscrew the oil lubricating nozzle from the oil feed tube end assembly and place the nozzle in a clean sealed container.

- (b) Unscrew the oil scavenge tube end assembly castellated nut using the cranked spanner (Tool 1598), then carefully withdraw the tube end assembly from the front cover unit.
- (c) Remove the sealing rings from the tube end assemblies. Place the tube end assemblies in a clean sealed container.
- (2) Unscrew the bolts securing the vent adapter tube to the raised flange, then withdraw the adapter tube from the front cover unit.
- Q. Remove Front Cover Unit from Bearing Support (Ref.Fig.108).
 - (1) Remove the small section of insulation blanket from the twin air duct location.
 - (2) Unscrew and remove the countersunk screws from the front face of the bearing support. Carefully withdraw the insulated front cover unit from the bearing support. Remove the insulating blankets from the front cover.
 - (a) Release the wire-locking securing the insulating blankets.
 - (b) Unscrew and remove the nuts securing the insulating blanket to the front cover, then remove the insulating blanket from the cover.
 - (3) Release the retaining rings securing the screwed connector bolts to the front cover, then withdraw the insulated drain tube and screwed connector from the front cover and remove the bolts.
 - (4) Remove the insulated tube from the screwed connector.
 - (a) Assemble the screwed connector to the vice holder (Tool 968) and secure with the special washers and thumbnuts.
 - (b) Clamp the vice holder in a bench vice.
 - (c) Unscrew the drain tube union nut from the screwed connector and remove the pipe.
 - (d) Release and remove the screwed connector from the vice holder.

(e) Reassemble the special washers and thumbnuts to the vice holder, then remove the holder from the bench vice.

(5) Release the straps and remove the insulation blanket from the drains tube.

R. Remove Bearing Housing from Bearing Support (Ref.Fig.108).

(1) Remove the nuts securing No.16 labyrinth ring, then withdraw the ring.

(2) Using immobilizer (Tool 841) on the left-hand nuts, and immobilizer (Tool 842) on the right-hand nuts, remove the nuts from inside the bearing housing.

(3) Remove the bolts and spacers from the rear face of the bearing support, then withdraw the bearing housing from the bearing support.

NOTE: If the bearing housing proves difficult to remove, the following procedure (para.(4) to (7)) must be carried out (Ref.Fig.109).

(4) Place the bearing support over bearing housing support (Tool 1961) to prevent the bearing housing from dropping inside the bearing support when removed.

(5) Assemble the mechanical puller (Tool 641) to the bearing support and housing engaging the puller legs with the machined recess in the bearing support flange. Adjust the puller to engage with the bearing housing.

(6) Carefully turn the large handle of the mechanical puller until the bearing housing is removed.

(7) Remove the mechanical puller and place the bearing support on the pallet (Tool 1014).

S. Remove Bearing from Bearing Housing (Ref.Fig.109).

(1) Remove the bolts securing the retaining ring to the bearing housing.

(2) Remove the oil jet locknut, then withdraw the retaining ring.

OLYMPUS 593

MK.610-14-28
OVERHAUL

- (3) Withdraw the bearing assembly from the bearing housing and place into a clean sealed container.
- NOTE: If SB.72-17 is embodied, ensure that the bearing retaining ring and bearing housing are kept as a matched set.
- T. Remove Squeeze Film Oil Jet from Bearing Housing (Ref.Fig.109).
- (1) Locate the mechanical puller (Tool 587) on the bearing housing and screw the puller thrust screw into the oil jet.
 - (2) Operate the puller and carefully extract the oil jet. Remove the oil jet from the puller.
- U. Remove Engine Mounting Trunnions and Remaining Components from Diffuser Case and C.C.O.C.
- (1) Remove the diffuser case from the stand.
 - (a) Attach crane hoist to the multiple leg sling (Tool 1191), then attach the sling to the diffuser case flange.
 - (b) Remove the nuts and bolts securing the diffuser case to the stand.
 - (c) Operate the hoist and transfer the diffuser case to a suitable working area in preparation for the removal of external items.
 - (2) Remove the engine mounting trunnions.
 - (a) Ensure the trunnions are supported, then remove the securing bolts and lift the trunnions away from the diffuser case.
 - (b) Withdraw the headless pins from the diffuser case using the impact puller (Tool 1653).
 - (3) Remove the elbow and the screwed plug and washer from the left-hand trunnion location on the diffuser case.
 - (4) Remove the elbow and insulated tube assembly from the right-hand trunnion location, then withdraw the insulated tube assembly. Release the straps and remove the insulation from the tube.

MK.610-14-28

OVERHAUL

- (5) Remove the bolts securing the the air duct to No.6 vane position and remove the duct.
- (6) Remove the bolts securing the cover blanks and brackets to the diffuser case and remove the blanks.
- (7) Using the special screwdriver (Tool 1626), release the screws securing the shoulder bolts to No.12 labyrinth seal locating flange, then remove the bolts.
- (8) Release and remove the inspection port mounting boss and gasket (SB.72-58), blanking plates (Pre SB.72-75) and thermocouple mounting blocks from the CCOC.
- (9) Remove saddle plates and igniter adapters from the CCOC incorporating bolted on igniters and pilot fuel sprayer mountings.
 - (a) Remove the bolts securing the igniter adapters to the saddle plates/CCOC. Remove the adapters and gaskets.
 - (b) Remove the screws securing the inner and outer saddle plates. Remove the saddle plates and gaskets.
- (10) Remove the bolts and pins (where practicable) from all disassembled components.

V. Disassemble HP Turbine Rotor Bearing.

CAUTION: COMPONENTS MUST BE LABELLED AND KEPT TOGETHER AS A SET.

- (1) Clean the bearing prior to disassembly (Ref.72-09-00 Cleaning Process D).
- (2) Disassemble the rollers and cage from the outer track.

NOTE: The following procedure should be done in an approved clean room.

- (a) Hinge open the lever of the pliers (Tool 1982) and locate the plier jaws over a roller.

OVERHAUL

- (b) Turn the tommy bar to apply sufficient force to the plier jaws to grip the roller, then close the lever and extract the roller from the cage.
- (c) Release the pliers and repeat the procedure until all rollers and cage are removed.
- (d) Place the rollers, cage and outer track in protective bags.

STANDARD PRACTICES - DISASSEMBLY

1. General

- A. Disassembly comprises dismantling the engine to sub-assemblies and then dismantling each sub-assembly to a sufficient depth to facilitate subsequent overhaul procedures.
- B. During the disassembly procedures it is assumed that all normal locking devices will be released prior to removing bolts, nuts, etc.
- C. Certain components (e.g. ball and roller bearings) shall be labelled, placed in clean plastic or PVC bags and passed to a 'clean room' immediately upon removal from the engine, where further disassembly and subsequent overhaul procedures are carried out. The components to which this applies are detailed in the applicable Chapters. Bearings which could be subject to unavoidable delays should be treated with a temporary corrosion protective solution (Ref. Standard Practices 72-09-00 Cleaning).
- D. It is recommended that Plus-Gas release agent is applied to bolt and/or nut threads, and allowed to soak, before attempting to remove them. This applies particularly to those components subjected to high temperatures.
- E. Approved blanks and covers shall be installed at the appropriate stages of disassembly to protect protruding items and joint faces, and to prevent the ingress of foreign matter.
- F. An initial examination of components shall be carried out as they are removed, and any evidence of defects which may be removed by cleaning shall be noted on the inspection report. These components shall then be passed to inspection for assessment of defects prior to cleaning.
- G. All self-locking nuts, captive nuts and inserts are reusable providing that they satisfy the Inspection/Check examination (Ref.72-09-00) and the locking (run-down) torque requirements specified in the relevant Sub-assembly Chapter.
- H. Appropriate measures shall be taken to collect spillage of oil, fuel, etc. as components are disconnected and/or removed.
- J. When disconnecting tubes having union nut type end fittings, the adapter and/or tube shall be prevented from turning with the union nut by using the appropriate wrenches.

sneema

- K. Where special containers and pallets are specified they must be used to segregate and protect components after disassembly. Other suitable containers should be used to fulfil the same purposes if special ones are not specified.

2. Locking Devices

- A. Split cotter pins must be removed and locking wire must be cut and removed prior to releasing nuts, etc. Similarly, keywashers and cupwashers must be unlocked sufficiently to give unimpeded spanner access and to allow the component to rotate.
- B. Cupwashers may be re-used, subject to satisfactory inspection (Ref. 72-09-00 Inspection/Check) and reconditioning (Ref. 72-09-00 Repair). Keywashers, except multi-tabbed types designed for re-use, shall be scrapped.
- C. Split cotter pins and locking wire shall be scrapped.

3. Sealing Devices

- A. Toroidal sealing rings shall be scrapped. Seal plates and metallic sealing rings shall be segregated and returned to the manufacturer for possible reconditioning.
- B. Gaskets, 'C' seals and similar items shall be scrapped.

4. Quick Attach/Detach (QAD) Couplings (Ref.Fig.101)

- A. Support the assembly to be removed with the specified lifting equipment.
- B. Unscrew and remove the coupling ring clamping bolt and spherical washer from the locking trunnion.
- C. Use the specified drift against the flat face of the release anvil and drive the coupling ring in the direction to separate the trunnions until it is just loosened.
- D. Turn the coupling ring by hand until the threads disengage and align with their withdrawal slots.
- E. Withdraw the assembly.
- F. Install the appropriate blanks.

OVERHAUL

5. Rim Clenching Clamp Assemblies

- A. When removing the clamp assembly, ensure that the outer eyebolt nut is released and removed prior to releasing the inner eyebolt nut.
- B. Retain the nuts with their respective eyebolts.

6. Tri-wing Fasteners (Ref.Fig.102)

- A. The size of the recess in the head of a tri-wing fastener is indicated by means of a number in a circle.
- B. It is essential when removing a tri-wing fastener that a driver bit carrying the same number as the fastener is used. The size number of the driver bit is marked on the shank, either contained within a circle or as a suffix to the part number.

7. Handling and Disposal of Asbestos Containing Materials (Ref. Tables 101 to 104)

- A. Tables 101 to 104 list all parts on the engine which contain asbestos.
- B. Dust or fibres released from asbestos containing materials or components, if inhaled, can cause serious harm to health including cancers of the respiratory system.
- C. Dust or fibres may be released during the handling of new components, as a result of the opening of asbestos containing joints and during the removal of service run components. Components subject to service running may become friable and be more prone to dust or fibre release.
- D. Asbestos present in Rolls-Royce components will be Chrysotile (white asbestos).
- E. National Health, Safety or Environmental regulations may exist which govern the handling and disposal of asbestos containing materials. It is the responsibility of the user to ensure compliance and to protect the health of employees working with such materials by preventing or containing any release, preventing personal exposure and ensuring workplace cleanliness.

(ATP E6868)

TR Page 1 of 1

15 April, 1996

TEMPORARY REVISION No. 72-596

THIS TEMPORARY REVISION IS ISSUED BY BRITISH AIRWAYS QUALITY AND TECHNICAL SERVICES AND COMPLIES WITH BCAR'S CHAPTER A5-3, B5-3 AND/OR TSS No. 0-2 AS REQUIRED. CAA DESIGN APPROVAL No. DAI/8566/78.

For CHIEF ENGINEER QUALITY AND TECHNICAL SERVICES.

Manual Reference DISASSEMBLY 72-09-00 Page 105

REASON FOR REVISION

To include instruction to restore the interference fit of steel bushes or linings.

ACTION

Add new Paragraph 8 as follows:

8. Steel Bushes or Linings

Restore interference fit by plating in accordance with BOR 5.

Originator: TIS
Reference: -
Workbook: GE 72-56

DISASSEMBLY

OVERHAUL

- F. The information given here is to assist the user in identifying the hazards and is not intended to replace national regulations, nor can it address all workplace situations. A risk assessment must be carried out by a person knowledgeable in the hazards, risks and controls necessary when working with asbestos.
- G. Components and materials must be sealed in strong plastic bags and clearly labelled as containing asbestos. An additional outer labelled bag should also be used. They must be treated as hazardous waste and be disposed of according to relevant local or national regulations.
- H. Asbestos containing materials are being replaced by non-asbestos alternatives. Some of these (eg. sheet gasket materials) may contain man-made or natural mineral fibres which may irritate the skin and respiratory system if released. Suitable precautions must be taken to avoid such irritation. Service or Modification bulletins should identify where alternatives have been authorised.

AIR INLET SECTION - DISASSEMBLY

1. General

- A. Prior to commencing disassembly refer to 72-09-00 Disassembly for general information.
- B. During disassembly reference is made to vane positions, the vanes being numbered from one to five counter-clockwise when viewed from the front face, with No.1 vane at the top.
- C. Throughout the text, special tools are quoted by their reference number; e.g. Tool 1324. For a complete list of the tooling required for assembly and for the Manufacturer's Part Number, refer to Special Tools, Fixtures and Equipment, Table 1001.

2. Disassemble the Air Inlet Section

- A. Assemble the Air Intake Case to the Stand (Ref.Fig.101).

NOTE: Two methods are given for attaching the air intake case to the stand (Ref.para.(2) and (4)). The method of para.(2) applies if the case is stored front face up, and the method in para.(4) if the case is stored front face down.

- (1) Assemble the holding fixture (Tool 1254) to the stand (Tool 1320) (Ref.Fig.101).

NOTE: This para. is applicable only if the method of para.(2) is to be used and the holding fixture is not already assembled to the stand.

- (a) Attach the lifting eye of the multiple leg sling (Tool 1255) to a hoist and position the hoist over the holding fixture. Attach the three shackles of the sling to the eyebolts of the fixture, and raise the fixture.
- (b) Ensure that the brackets of the stand extend upwards. Traverse the fixture beneath the brackets, then raise the fixture to abut the brackets. Align the bolt-holes and secure with the eight nuts and bolts.

- (c) Release the shackles from the eyebolts, then move the sling away from the holding fixture and release the hoist. Rotate the stand handle and invert the fixture so that the eyebolts point downwards.
- (2) Assemble the air intake case to the holding fixture (Ref.Fig.101).

NOTE: This para. is only applicable if the case is stored front face up.

- (a) Attach the lifting ring of the lifting fixture (Tool 894) to the hoist, then position the fixture over the intake case. Lower the fixture and engage its legs under three of the case vanes, then raise the case off the pallet and position it above the holding fixture.
- (b) Ensure that the clamps of the holding fixture face outwards and are clear of the case rear flange. Align the locating hole on the flange near vane No.1 with the short dowel on the fixture and lower the case onto the fixture. Screw the captive bolts of the holding fixture into the threads in the intake case rear flange, then turn the holding fixture clamps onto the intake case flange and tighten their retaining nuts.
- (c) Lower the hoist, release the lifting fixture legs from the intake case vanes, then raise the lifting fixture clear of the case. Remove the fixture from the hoist.
- (3) Remove the holding fixture (Tool 1254) from the stand (Tool 1320).

NOTE: This para. is only applicable if the method of para.(4) is to be used and if the holding fixture is assembled to the stand.

- (a) Invert the build stand so that the bottom face of the holding fixture is uppermost, then secure the shackles of the multiple leg sling (Tool 1255) to the eye-bolts of the fixture.

DISASSEMBLY

72-20-00

OVERHAUL

- (b) Support the weight of the holding fixture with the lifting equipment, then release and remove the eight nuts and bolts securing the holding fixture to the stand.
- (c) Lower the fixture and traverse from under the brackets of the stand.
- (4) Assemble the air intake case to the holding fixture.

NOTE: This para. is only applicable if the case is stored front face down.

- (a) Ensure that the clamps of the holding fixture face outwards, rotate the fixture to align the locating hole on the rear flange near vane No.1 with the short dowel on the fixture and carefully lower the fixture onto the case ensuring that the cut-out on the fixture clears the anti-icing duct at vane 2 (Ref.Fig.102).
 - (b) Screw the captive bolts of the holding fixture into the threads in the intake rear flange, then turn the holding fixture clamps onto the intake case flange and tighten the retaining nuts.
 - (c) Raise the hoist and traverse the fixture beneath the brackets of the build stand which should be pointing upwards.
 - (d) Raise the fixture to engage with the brackets, and secure with the eight bolts and nuts.
 - (e) Release the shackles from the eye-bolts, remove the sling from the hoist and rotate the stand to bring the front face of the case uppermost.
- B. Remove the Rear Baffle and Labyrinth Housing (Ref.Fig.102).
- (1) Rotate the stand to invert the case.
 - (2) Remove the 18 bolts securing the rear baffle to the air intake case, and the 18 bolts securing the rear baffle to the inner baffle, then remove the nine bolts securing the rear baffle and labyrinth housing to the bearing housing.

OVERHAUL

- (3) Lift the rear baffle and labyrinth housing from the assembly and place in container (Tool 1466).

C. Remove the Lubrication System Components (Ref.Fig.103).

- (1) Screw the puller (Tool 888) into the threads of the filter housed in the oil feed flange at vane No.3. Pull the filter from the housing, then remove the puller from the filter.
- (2) Remove the eight bolts securing the oil feed flange to the oil tube and anti-icing duct at No.3 vane. Remove the flange and gasket if SB.72-35 is embodied, then attach a protector (Tool 1879) to the sealing face of the flange.
- (3) Remove the eight bolts securing the oil scavenge flange and bracket to the oil tube and anti-icing duct at No.4 vane. Remove the flange, bracket and gasket if SB.72-35 is embodied, then attach a protector (Tool 1879) to the sealing face of the flange.
- (4) Using cranked wrenches (Tool 880 and 881), release the two nuts securing the olive ends of the two inner oil tubes, then slide the nuts along the tubes away from the bearing housing. Using ring wrenches (Tool 1604 and 1605), remove the four nuts and bolts securing the outer ends of the two inner oil tubes to the flanges of the outer oil tubes located in No.3 and No.4 vane.

NOTE: If SB.72-80 is embodied the nut securing the nut retainer must be released last.

- (5) Pull the outer end of the inner oil tubes away from the flanges, then gradually withdraw the olive ends of the inner oil tubes from the bearing housing until released. Attach protectors (Tool 893) to the sealing faces of the oil tubes.

- (6) Remove the two bolts and detach the two clamps retaining the seals at the inner ends of the outer oil tubes and inner baffle. Gently prise the oil tubes at the inner end to free them from the seals, then withdraw the tubes from the outer end of vanes. If the oil tubes are difficult to remove, secure the adapter (Tool 519) to the outside end of the tubes with engine bolts, then screw the impact puller (Tool 1690) into the adapter and operate the puller to remove the tube. Release and remove the puller and adapter. Attach protectors (Tool 893 and 889) to the oil tube sealing faces.

D. Remove and Disassemble Bearing Housing Assembly (Ref. Fig.102).

- (1) Remove the 10 nuts and bolts securing the inner baffle assembly and bearing housing to the front flange of the case. Remove the inner baffle assembly, then lift out the bearing housing complete with the bearing and place on a bench.
- (2) Unscrew and remove the seven bolts attaching the bearing retaining plate to the housing, then lift the retaining plate off the three headless locating pins. Gently apply thumb pressure to the bearing inner face and withdraw the bearing. Place the inner baffle, retaining plate and bearing housing in container (Tool 1466).

E. Remove the Front Flange and Tube (Ref.Fig.102 and 103).

- (1) Unscrew and remove the 20 nuts from the D-headed bolts securing the front flange to the air intake case and pull the front flange from the case. Place the front flange in container (Tool 1466).
- (2) Turn the bolts so that their D-heads are clear of the groove in the case, then withdraw the bolts.
- (3) Unscrew and remove the two countersunk headed bolts from the front flange of the case and remove the electrical tube.

F. Remove the Anti-icing Manifold (Ref.Fig.104).

- (1) Remove the duct at vane 5.
 - (a) Remove the securing nut, bolt and retainer at vane 1.

- (b) Remove the six bolts securing the duct to the intake case at vane 5 and detach the duct.
- (2) Remove the duct at vane 1.
 - (a) Remove the securing nut, bolt and retainer at vane 2.
 - (b) Remove the six bolts securing the duct to the intake case at vane 2 and detach the duct.
 - (c) Remove the sealing rings from the duct.
- (3) Remove the duct at vane 2.
 - (a) Remove the securing nut, bolt and retainer between vane 2 and vane 3.
 - (b) Remove the six bolts securing the duct to the intake case at vane 2 and detach the duct together with packing plate if installed.
 - (c) Remove the flanged sleeve from the inlet connection.
- (4) Remove the connector at vane 4.
 - (a) Remove the three bolts securing the bracket and duct to the connector at vane 4.
 - (b) Remove the six bolts securing the connector to the intake case at vane 4 and remove the connector.
 - (c) Attach protector (Tool 879) to the connector.
- (5) Remove the duct at vane 3.
 - (a) Remove the securing nut, bolt and retainer at vane 3, then remove the duct leading to vane 4.
 - (b) Remove the six bolts securing the duct to the intake case at vane 3 together with packing plate if installed and detach the duct. Attach protector (Tool 879) to the face of the duct.
 - (c) Remove the sealing rings from both ducts.
- (6) Place all removed components into container (Tool 1880).

G. Disassemble LP Compressor Rotor Front Bearing.

CAUTION: COMPONENTS MUST BE LABELLED AND KEPT TOGETHER AS A SET.

- (1) Clean the bearing prior to disassembly (Ref.72-09-00 Cleaning Process D).
- (2) Disassemble the rollers and cage from the outer track.

NOTE: The following procedure should be done in an approved clean room.

- (a) Hinge open the lever of the pliers (Tool 1983) and locate the plier jaws over a roller.
- (b) Turn the tommy bar to apply sufficient force to the plier jaws to grip the roller, then close the lever and extract the roller from the cage. Release the pliers from the roller.
- (c) Repeat the procedure until all the rollers are removed, then withdraw the cage.
- (d) Place the rollers, outer track and cage in protective bags.

LP COMPRESSOR ASSEMBLY - DISASSEMBLY

1. General

- A. Prior to commencing the disassembly, refer to 72-09-00, Disassembly for general information.
- B. Throughout the text special tools are quoted by their Ref.No. e.g. (Tool 1234). For a complete list of tooling required for the disassembly refer to Special Tools, Fixtures and Equipment Table 1001.
- C. The LP compressor assembly will be received, rear flange uppermost, from the Engine Bulk Disassembly. The LP thrust bearing assembly will have been removed from the compressor and a balancing bearing assembly assembled in its place to which a rear bearing adapter plate is attached and slave exit guide vane cases interspersed between the adapter plate and rear flange of the LP case. A balancing bearing adapter is also assembled to the front of the compressor, the outer rim of the adapter is spigot located in the mobile stand which supports the assembly. The rotating assembly is supported by the rear bearing adapter.
- D. If a check balance of the LP compressor assembly is required, remove the assembly from the mobile stand, turn it to the horizontal position, then assemble it to the balancing machine. Carry out the balancing procedure in accordance with 72-31-00 Assembly para.13. Should a check balance of the individual rotor disks be required during disassembly refer to 72-31-03 Assembly.
- E. To facilitate disassembly the compressor will require removing from the mobile stand, turned through 180 deg, (front flange uppermost) and then assembled to the disassembly stand. During the "turning over" procedure both front and rear bearing adapters will remain assembled to the compressor. The compressor will be disassembled only as far as the stage 6 stator vanes, the case will be raised from the slave exit guide attachment flange and transferred to 72-31-01 for disassembly of the stage 6 stator vanes and brackets. The remaining stage 7 rotor disk, spacer ring and rotor shaft rear will be transferred to the turnover stand for removal of the rear bearing adapter and balancing bearing assembly. The vane fixing rings will be disassembled under 72-31-01.

SNECMA

OVERHAUL

2. Prepare the LP Compressor Assembly for Disassembly

A. Remove the LP Compressor Assembly from the Mobile Stand.

- (1) Check that the rear bearing adapter (3163) is correctly assembled to the LP compressor rear flange and that the inner ring of bolts securing the rear adapter to the balancing bearing assembly are tight (Ref.Fig.101).
- (2) Ensure that the lifting fixture (Tool 1096) has eight captive bolts, then offer the fixture to the rear bearing adapter aligning the offset captive bolt and threaded hole. Screw in and fully tighten the bolts. Check that the LP case front flange is securely bolted to the front bearing adapter (Tool 588).
- (3) Attach a hoist to the lifting fixture (Tool 1096), then moving the hoist as necessary, raise the compressor assembly until it clears the mobile stand.

B. Turn the LP Compressor Assembly to the Horizontal Position.

- (1) Identify the offset bolt position in the trunnion adapter (Tool 1097) then align it with the corresponding offset tapped hole in the front bearing adapter (Tool 588), screw in the four captive bolts and fully tighten.
- (2) Ensure the two locking bars of the front support (Tool 1076) are released. Raise the hoist and position the assembly so that the trunnion adapter aligns with the support (Tool 1076). Operate the hoist as necessary to align the trunnion adapter bar (Tool 1097) so that it rests in the support (Tool 1076). Secure the trunnion adapter bar with the two locking bars of the support.

OVERHAUL

WARNING: AVOID JERKING THE HOIST WHEN TRAVERSING TO OBVIATE THE DANGER OF DISENGAGING THE FRONT TRUNNION FROM THE SUPPORT.

- (3) Ensure that the eye of the lifting fixture (Tool 1096) points to the top of the compressor case, easily recognized by the lifting point on the front bearing adapter. Slowly lower the compressor assembly, pivoting about the front support. Continue to lower the assembly, simultaneously adjusting the traverse on the hoist to coincide with the changing angle of the compressor assembly until it reaches the horizontal position (Ref.Fig.102).

C. Turn the LP Compressor Assembly Front Bearing Adapter Uppermost.

- (1) Position the rear support (Tool 1306) to locate in the channel of the rear bearing adapter (Tool 344), it may be necessary to raise/lower the hoist for final adjustment. Lower the hoist then remove the hook from the lifting fixture.
- (2) Attach the hoist to the lifting beam (Tool 1056), then position the beam over the LP compressor assembly so that the whips of the beam align the lifting eyes on the front and rear adapters. Secure the whips to the compressor assembly with the two shackles (Ref.Fig.103).

NOTE: The lifting beam adjustment handle should be to the front of the LP compressor assembly.

- (3) Release the locking bars of the support stand (Tool 1076), then steadily raise the hoist adjusting the lifting beam (if necessary) to support the compressor assembly in the horizontal position. Raise the compressor clear of the supports.
- (4) Unscrew and remove the lifting fixture from the rear bearing adapter. Remove the trunnion adapter from the front bearing adapter, then assemble the same trunnion adapter to the rear bearing adapter and tighten the trunnion securing bolts. Assemble the lifting fixture (Tool 1098) to the front bearing adapter and secure.

- (5) Ensure that the compressor assembly is well clear of any obstacle, then turn the assembly so that the rear bearing adapter is aligned with the support (Tool 1076). Place the support (Tool 1306) to the front of the compressor. Lower the compressor assembly onto the two supports. Lock the rear trunnion adapter in position with the locking bars.
 - (6) With the LP compressor assembly secure in the two supports, remove the horizontal lifting beam shackle pins, lower the beam onto a suitable platform and replace the shackle pins.
 - (7) Attach the hook of the hoist to the lifting fixture (Tool 1098) now bolted to the front bearing adapter inner flange. Carefully raise the hoist, simultaneously traversing the crane as required through the changing angle until the front adapter is uppermost and the compressor assembly is vertical (Ref.Fig.103A).
- D. Assemble the LP Compressor Assembly to the Build Stand (Ref.Fig.104).
- (1) Raise the crane sufficiently to take up the compressor assembly's weight, but do not impart strain on the locking latches of the support underneath. Release the locking latches securing the rear trunnion. Carefully raise the hoist making sure that the locking latches do not become fast on the rear bearing adapter as the bars pivot upwards. Replace the locking latches securing screws.
 - (2) Lower the hoist until the rear adapter abuts the build stand. Disconnect the hoist then remove the lifting fixture.
- E. Remove the Front Bearing Adapter (Ref.Fig.105).
- (1) Assemble the lifting fixture (Tool 1096) to the front bearing adapter, note the offset bolt position.
 - (2) Remove the slave nuts and bolts securing the front bearing adapter to the LP compressor front flange, place the nuts and bolts in a canvas bag and tie to the front adapter flange. Carefully raise the hoist and steady the front adapter over the LP front bearing outer track.

- (3) Raise the front adapter clear of the compressor assembly then lower the adapter onto a pallet. Disconnect the hoist then remove the lifting fixture.
3. Disassemble the Rotor Shaft Front, Rotor Disks, Stator Vanes, Spacer Rings and Inner Fixing Rings
 - A. Remove the Rotor Shaft Front and the Balancing Bolts.
 - (1) Check bolt protrusion through nuts before slackening. Note bolts with less than 2.5 thread pitches showing beyond nut chamfer and discard them when removed (Ref.SB.72-8449-191).
 - (2) Assemble the mechanical puller (Tool 629) to the rotor shaft front (Ref.Fig.106), engaging the three legs in the recesses behind the inner track, then operate the puller and carefully withdraw the track. Remove the puller and place the inner track in a container.
 - (3) Position a platform stand (Tool 1214) near the compressor case for a convenient working height.
 - (4) Remove the 14 nuts securing the rotor shaft front to the stage 1 rotor disk. Using a mechanical driver (Ref.Fig.107) (Tool 1603) and a suitable hammer carefully drift the bolts rearwards. Remove the rotor shaft front and place the shaft on a suitable worktop.
 - B. Remove the Stage 1 Bladed Rotor Disk.
 - (1) Assemble a blade retainer band (Tool 1166) to each pair of stage 1 rotor blades. The bands are to be nearer the blade tips and their retaining fasteners uppermost.
 - (2) Assemble a multiple leg sling (Tool 1103) to the stage 1 rotor blades (Ref.Fig.108).
 - (a) Attach a hoist to the lifting sling ring, raise the hoist then position the sling over the rotor disk.
 - (b) Ensure that the tommy bars of the legs are pointing to 'FREE', then lower the hoist guiding the legs between the rotor blades. When the three pads of the sling rest on the blade roots turn the tommy bars to 'LIFT'.

OVERHAUL

- (3) Check that none of the 14 rotor shaft front/stage 1 disk securing bolts are lodged in the rotor disk holes. Operate the hoist then raise the rotor disk clear of the compressor assembly (Ref.Fig.108). Lower the bladed disk onto a pallet, then disconnect the hoist and remove the lifting fixture. Expand a protection band (Tool 1123) around the blade tips. Do not remove the protection band or blade retaining clips from the rotor blades. Remove the 14 stage 1 disk/rotor shaft front retaining bolts.
- C. Remove the Stage 1-2 Spacer Ring and the Stage 1 Stator Vanes.
- (1) Using the wrench (Tool 1627) and turning key (Tool 987), remove the 20 locknuts securing the stage 1-2 spacer ring and the stage 2 rotor disk. Using the mechanical driver (Tool 1610) and a suitable mallet carefully drive the bolts rearwards paying particular attention not to damage the bolts or their threads. Remove the spacer ring from the disk face, then assemble a protector (Tool 443) to the labyrinth on the spacer ring. Place the spacer ring in the appropriate part of the container (Tool 1410).
- (2) Unscrew and remove the two locknuts securing the retaining piece to the bolted vane fixing ring position (loading slot). Ease the retaining piece over the two bolts protruding from the vane fixing ring and remove.
- (3) Remove and discard the locking wire from the bolts securing the bolted vane and probe vane on the outside of the compressor case at stage 1 stator vane location. Unscrew and remove the bolts and sleeves from this position also the support plug assembly. Place bolts, sleeves, plug and support plug assembly in a container.
- (4) Ease the bolted vane at the loading slot position from the vane fixing ring, then place the vane in a container (Tool 1377). Ease the remainder of the vanes clockwise/counter-clockwise disengaging each vane through the loading slot location. Place all the vanes in the container. Remove the vane fixing ring and place in the appropriate part of the container (Tool 1440).

D. Remove the Stage 2 Rotor Disk and the Stage 2-3 Spacer Ring.

- (1) Assemble a blade retainer band (Tool 1166) to each pair of stage 2 rotor blades. The bands are to be nearer the blade tips and their retaining fasteners uppermost.
- (2) Assemble a multiple leg sling (Tool 1102) to the stage 2 rotor blades (Ref.Fig.108).
 - (a) Attach a hoist to the lifting sling ring, raise the hoist then position the sling centrally over the rotor disk.
 - (b) Ensure that the tommy bars of the legs are pointing to 'FREE', then lower the hoist guiding the legs between the rotor blades. When the three pads of the sling rest on the blade roots turn the tommy bars to 'LIFT'.
- (3) Check that none of the 20 stage 1-2 spacer ring/ stage 2 rotor disk securing bolts are lodged in the stage 2 disk holes. Operate the hoist raising the rotor disk above the LP case, taking care not to allow the disk to swing causing damage to the rotor blades or case. Lower the disk onto a pallet. Turn the tommy bars of the lifting sling to 'FREE' raise the lifting sling clear of the rotor disk then place the sling on its storage rack, disconnect the hoist. Expand a protection band (Tool 1124) around the tips of the stage 2 rotor disk. Remove the 20 bolts resting on the stage 3 rotor disk.
- (4) Using the wrench (Tool 1591) and location key (Tool 1590), remove the 24 nuts securing the stage 2-3 spacer ring and the stage 3 rotor disk.
- (5) Using the mechanical driver (Tool 1610) and a suitable mallet, drift the stage 3 rotor securing bolts rearwards taking care not to damage the bolts or their threads. Remove the spacer ring, assemble a protector (Tool 1167) to the labyrinth, then place the spacer ring in the appropriate part of the container (Tool 1410).

E. Remove the Stage 2 Stator Vanes.

- (1) Unscrew and remove the two locknuts securing the retaining piece, from the bolted vane fixing ring position (loading slot). Ease the retaining piece over the two bolts protruding from the vane fixing ring and remove.
- (2) Remove and discard the locking wire from the bolts securing the bolted vane and probe vane on the outside of the compressor case at stage 2 stator vane location. Unscrew and remove the bolts and sleeves from this position. Remove the support plug assembly and place the items in a container.
- (3) Ease the bolted vane at the loading slot position from the vane fixing ring, then place the vane in a container (Tool 1376). Remove the remainder of the vanes from the case, easing the vanes clockwise/ counter-clockwise disengaging each vane through the loading slot location. Place all the vanes in the container. Remove the vane fixing ring and place in the appropriate part of the container (Tool 1440).

F. Remove the Stage 3 Rotor Disk and the Stage 3-4 Spacer Ring.

- (1) Assemble the lifting fixture (Tool 1161) (Ref.Fig.109) to the front face of the stage 3 rotor disk. Guide the three claws through the centre hole then turn the claws outwards to lock and locate on the rear face of the disk. Screw down the three thumbnuts to secure the claws in the locked position.
- (2) Attach the hoist to the lifting fixture, adjust the hoist so that it is centrally aligned with the rotor disk. Check that none of the 24 stage 3-4 spacer ring/stage 3 rotor disk securing bolts are lodged in the disk holes. Raise the rotor disk clear of the compressor case, avoid the disk swinging causing damage to the blades or compressor case.

- (3) Lower the rotor disk onto a pallet, disconnect the hoist, then remove the lifting fixture from the centre of the disk. Expand a protection band (Tool 1125) around the stage 3 rotor blade tips. Remove the 24 bolts resting on the stage 4 rotor disk.

NOTE: Prior to carrying out the following operation, check bolt protrusion through nuts before slackening. Note bolts with less than 2.5 thread pitches showing beyond nut chamfer and discard them when removed (Ref.SB.72-8449-191).

- (4) Using the wrench (Tool 1591) and location key (Tool 1590), unscrew and remove the 24 locknuts from the stage 3-4 spacer ring.
- (5) Using the mechanical driver (Tool 1610) and a suitable mallet, drive the stage 4 disk securing bolts rearwards taking care not to damage the bolts. Remove the stage 3-4 spacer ring, assemble a protector (Tool 1168) to the labyrinth, then place the spacer ring in the appropriate part of the container (Tool 1411).

G. Remove the Stage 3 Stator Vanes (Ref.Fig.110 and 111).

- (1) Unscrew and remove the two locknuts securing the retaining piece at the stage 3 loading slot vane fixing ring positions, then remove the retaining piece.
- (2) Remove and discard the locking wire from the bolts securing the bolted vanes and probe vanes on the outside of the compressor case. Remove the bolts and sleeves from these positions. Remove the support plug assembly and place the items in a container.
- (3) Moving the stator vanes clockwise or counter-clockwise as appropriate remove the stage 3 vanes from the compressor case loading slot location. Place the vanes in a container (Tool 1375). Remove the vane fixing ring and place the ring in the appropriate part of the container (Tool 1440).

H. Remove the Stage 4 Rotor Disk and the Stage 4-5 Spacer Ring.

- (1) Assemble the lifting fixture (Tool 1161) (Ref.Fig.109) to the front face of the stage 4 rotor disk. Guide the three claws through the centre hole then turn the claws outward to lock and locate on the rear face of the disk. Screw down the three thumbnuts to secure the claws in the locked position.
- (2) Attach the overhead hoist to the lifting fixture. Check that none of the 24 stage 4-5 spacer ring/ stage 4 rotor disk securing bolts are lodged in the disk holes. Raise the rotor disk clear of the compressor case, avoid the disk swinging causing damage to the blades or compressor case.
- (3) Lower the rotor disk onto a pallet, disconnect the hoist, then remove the lifting fixture from the centre of the disk. Expand a protection band (Tool 1126) around the stage 4 rotor blade tips. Remove the 24 bolts resting on the stage 5 rotor disk.
- (4) Check bolt protrusion through nuts before slackening. Note bolts with less than 2.5 thread pitches showing beyond nut chamfer and discard them when removed (Ref.SB.72-8449-191).
- (5) Using the wrench (Tool 627) and location key (Tool 1590), unscrew and remove the 24 locknuts securing the stage 5-6 spacer ring and stage 5 disk. Using the mechanical driver (Tool 1610) and a suitable mallet, drive the 24 bolts rearwards avoiding damage to the bolts. Remove the spacer ring then assemble a protector (Tool 1169) to the spacer ring labyrinth. Place the ring in its container (Tool 1411).

J. Remove the Stage 4 Stator Vanes (Ref.Fig.110 and 111).

- (1) Unscrew and remove the two locknuts securing the retaining piece at the stage 4 loading slot inner fixing ring position, then remove the retaining piece.
- (2) Remove and discard the locking wire from the bolts securing the bolted vanes and probe vanes on the outside of the compressor case. Remove the bolts and sleeves from these positions. Remove the support plug assembly, then place the items in a container.

OVERHAUL

- (3) Easing the stator vanes clockwise or counter-clockwise as appropriate, to facilitate their disengagement through the loading slot, remove the stage 4 stator vanes. Place the vanes in a container (Tool 1391). Remove the vane fixing ring from the compressor case and place the ring in the appropriate part of the container (Tool 1440).
- K. Remove the Stage 5 Rotor Disk and the Stage 5-6 Spacer Ring.
- (1) Assemble the lifting fixture (Tool 1161) (Ref.Fig.109) to the centre hole of the stage 5 rotor disk. Guide the three claws through the centre hole, then turn the claws outward to lock and locate on the rear face of the disk. Screw down the three thumbnuts to secure the claws in the locked position.
 - (2) Attach the overhead hoist to the lifting fixture. Check that none of the 24 stage 5-6 spacer ring/ stage 5 rotor disk securing bolts are lodged in the disk holes. Raise the rotor disk clear of the compressor case, avoid the disk swinging causing damage to the blades or the compressor case.
 - (3) Lower the rotor disk onto a pallet, disconnect the hoist, then remove the lifting fixture from the centre of the disk. Expand a protection band (Tool 1127) around the stage 5 rotor blade tips. Remove the 24 bolts resting on the stage 6 rotor disk.
 - (4) Remove the three blanking plates at three equi-spaced positions from the outside of the slave exit guide vane case. Adjust the three adjustable supports (Tool 1006) to their minimum adjustment, then feed the supports through the three equi-spaced holes in the slave exit guide case so that they rest on the three machined faces in the rear bearing adapter. Secure each support with the thumbnuts.
 - (5) Readjust the three supports (Tool 1006) so that each support abuts the rear face of the stage 7 rotor disk.
 - (6) Check bolt protrusion through nuts before slackening. Note bolts with less than 2.5 thread pitches showing beyond nut chamfer and discard them when removed (Ref. SB.72-8449-191).

OVERHAUL

- (7) Using the wrench (Tool 627) and location key (Tool 1590), slacken the 24 locknuts securing the stage 5-6 spacer ring and stage 6 rotor disk. Do not remove the nuts, but unscrew each nut sufficiently to assemble a retaining clip (Tool 1038) between the rear of the nut face and the spacer ring. With the bolts held in position by the retaining clips remove the nuts and place them in a container.
- (8) Screw an assembly pin (Tool 1065) onto each of the 24 bolts being retained by a clip, then remove the retaining clips. Gently tap on the pins moving the bolts rearwards to rest on the disk below. Guide the spacer ring upwards over the pins and remove. Assemble a protector (Tool 1169) to the spacer ring labyrinth and place the spacer ring in the appropriate part of the container (Tool 1411).

L. Remove the Stage 5 Stator Vanes (Ref.Fig.110 and 111).

- (1) Unscrew and remove the two locknuts securing the retaining piece at the stage 5 loading slot vane fixing ring position, then remove the retaining piece.
- (2) Remove and discard the locking wire from the bolts securing the bolted vanes and probe vanes on the outside of the compressor case. Remove the bolts and sleeves from these positions. Remove the support plug assembly, then place the items in a container.
- (3) Easing the stator vanes clockwise or counter-clockwise as appropriate to facilitate their disengagement through the loading slot, remove the stage 5 stator vanes. Place the vanes in a container (Tool 1392). Remove the vane fixing ring from the compressor case and place the ring in the appropriate part of the container (Tool 1440).

M. Remove the Stage 6 Rotor Disk (Ref.Fig.109).

- (1) Assemble the lifting fixture (Tool 1161) to the centre hole of the stage 6 rotor disk. Guide the three claws through the centre hole, then turn the claws outward to lock and locate on the rear face of the disk. Screw down the three thumbnuts to secure the claws in the locked position.

DISASSEMBLY

72-31-00

OVERHAUL

- (2) Attach the overhead hoist to the lifting fixture. Raise the hoist carefully guiding the rotor disk upwards over the assembly pins, avoiding the disk swinging and causing damage to the blades or the compressor case.
- (3) Lower the rotor disk onto a pallet, disconnect the hoist, then remove the lifting fixture from the centre of the disk. Expand a protection band (Tool 1128) around the stage 6 rotor blade tips.

4. Transfer the LP Compressor Case to the Disassembly Stand

A. Release the LP Compressor Case from the Slave Exit Guide Cases.

- (1) Remove the slave nuts and bolts securing the compressor case rear flange to the slave exit guide cases.
- (2) Attach the multiple leg sling (Tool 1101) to the overhead hoist, then position the sling over the compressor case. Equally space each of the slings attachment plates around the front flange and secure with the thumbscrews. Centralize the hoist then carefully raise the compressor case taking care to keep the case centralized. Raise the case clear of the disassembly platform (Ref.Fig.112).
- (3) Lower the compressor case onto a suitable pallet then disconnect the hoist from the multiple leg sling. Transfer the compressor case on the pallet to the disassembly stand, if the case is not to be disassembled immediately, remove the multiple leg sling.

NOTE: The remaining stage 6 stator vanes, brackets and vane fixing rings will be disassembled under Chapter 72-31-01, Disassembly.

OLYMPUS 593

5. Assemble the Rear Bearing Adapter and the Stage 7 Rotor Disk Assembly to the Turnover Stand

A. Remove the Rear Bearing Adapter and the Stage 7 Rotor Disk Assembly from the Build Stand (Ref.Fig.112 and 113).

- (1) Remove the axial nuts and bolts securing the top and bottom slave exit guide cases to each other. Remove the slave nuts and bolts securing the slave exit guide cases to the rear bearing adapter.
- (2) Withdraw the exit guide cases from the rear bearing adapter, then place them on a pallet, keeping the cases together as a matched pair. Place the slave nuts and bolts in a container and place them with the exit guide cases.
- (3) Pull on the assembly pins assembled to the 24 bolts so that each of the 24 bolts is moved forward through the disk bolt holes and the flat of each bolt located against the rim of the stage 6-7 spacer ring. As each bolt is pulled fully forward assemble a retaining clip (Tool 1038) to the unthreaded diameter of the bolt. Make sure that each bolt is retained with a clip then remove the assembly pins.
- (4) Assemble the mounting plate (Tool 1294) to the stage 7 disk assembly.
 - (a) Make sure that the 24 retaining clips assembled to the bolts are so positioned that the 'L' shape tangs are turned outwards.
 - (b) Attach the overhead hoist to the lifting ring of the mounting plate. Raise the hoist and position the mounting plate over the stage 7 rotor disk.
 - (c) Align the 24 holes in the mounting plate with the 24 bolts protruding from the stage 7 disk assembly.
 - (d) Lower the mounting plate onto the bolts, so that it abuts the rotor shaft rear flange. Make sure that all the clips are accommodated in the 24 recesses machined in the mounting plate.
 - (e) Secure the mounting plate at four equi-spaced positions with four slave nuts.

- (5) Operate the hoist and carefully raise the assembly so that the bearing adapter disengages from the build stand (Ref.Fig.113).

B. Prepare the Turnover Stand (Ref.Fig.114).

- (1) Depress the pedal, of the turnover stand (Tool 697), controlling the lock on the trunnion arm, then turn the cranked handle of the turnover stand to bring the moveable arm into its uppermost position.

WARNING: KEEP CLEAR OF THE TRUNNION ARM WHEN
RELEASING LOCKING PIN.

NOTE: The trunnion arm attached to the opposite column is independant from any mechanical control after the locking pin has been released, and is thus free to move left or right.

- (2) Release the locking pin securing the trunnion arm, then reposition the arm to its uppermost position. Lock the arm with the pin.

C. Assemble the Stage 7 Rotor Disk Assembly to the Turnover Stand.

- (1) Operate the hoist and position the stage 7 disk assembly centrally over the turnover stand (Tool 697).
- (2) Lower the stage 7 disk assembly onto the trunnion arms taking care not to damage the stage 7 blades against the stand. Secure the assembly to the trunnion arms with slave nuts and washers. Disconnect the hoist.
- (3) Pull the pin to release the arm, turn the thumbscrew on the pin to retain the pin in the unlocked position. Depress the pedal controlling the lock on the opposite trunnion arm, then turn the stand through 180 deg. so that the rear bearing adapter is uppermost. Using the locking pin and foot pedal lock both the trunnion arms.

OVERHAUL

6. Disassemble the Stage 7 Rotor Disk, Rotor Shaft Rear and the Rear Bearing Adapter

A. Remove the Rear Bearing Adapter (Ref.Fig.114).

- (1) Unscrew the bolts retaining the rear trunnion to the rear adapter then remove the trunnion.
- (2) Assemble the lifting fixture (Tool 1096) to the rear face of the rear bearing adapter, note the offset bolt position. Screw in and fully tighten the four captive bolts.
- (3) Attach the overhead hoist to the lifting fixture. Unscrew the captive bolts securing the rear adapter to the balancing bearing assembly assembled to the rotor shaft rear.
- (4) Centrally align the hoist attachment with the lifting fixture, then slowly take up the slack in the lifting fixture. Before taking the weight of the rear bearing adapter, make sure that the captive bolts are completely unscrewed from the balancing bearing assembly, and that although the bolts remain captive in the rear bearing adapter, they are able to move quite freely a limited distance rearwards.
- (5) Operate the hoist and remove the rear bearing adapter by carefully raising the adapter clear of the turnover stand. Lower the rear bearing adapter onto a pallet, disconnect the hoist, then remove the lifting fixture.

B. Remove the LP Compressor Bearing Retaining Nut (Ref.Fig. 115).

- (1) Insert the sleeve (Tool 696) into the rotor shaft rear, then engage the immobiliser (Tool 280) into the splines of the rotor shaft. Ensure that the spanner (Tool 1594) is bolted to the multiplier (Tool 1022).

OVERHAUL

- (2) Raise the multiplier/spanner over the rotor shaft rear, then guide the spanner (Tool 1594) down over the rotor shaft and engage it in the bearing retaining nut. It may be necessary to turn the square in the top of the multiplier to effect engagement of the drive in the immobiliser. Care must be taken to keep fingers clear of the spanner castellations.

NOTE: The operator should always check the input/output ratio of any multiplier being used also the correct rotation to effect a torque or detorque procedure. The multiplier in this case has a 25 to 1 ratio.

- (3) Disconnect the hoist from the multiplier. Using the wrench (Tool 1651), detorque the LP compressor retaining nut. Connect the hoist to the multiplier then carefully remove the multiplier and place it on a pallet. Withdraw the immobiliser from the rotor shaft rear.

- (4) Remove the LP bearing retaining nut and washer.

C. Remove the LP Compressor Balancing Bearing Assembly (Ref.Fig.115).

- (1) Assemble the mechanical puller (Tool 283) to the rotor shaft rear.
- (a) Screw the central threaded shroud of the puller onto the rotor shaft rear. Engage sufficient threads of the shroud to operate the puller but do not overtighten.
 - (b) Secure the puller to the balancing bearing outer location with the captive bolts and fully tighten the bolts.
- (2) Turn the puller tommy bar in a clockwise direction to remove the balancing bearing assembly with spacer sleeve. When the balancing bearing becomes free of its interference location, lift the puller, bearing assembly and sleeve clear of the rotor shaft.

- (3) Place the balancing bearing assembly and puller onto a suitable worktop, unscrew the captive securing bolts from the outer flange, then remove the puller from the bearing assembly.
 - (4) Assemble the two bearing protectors (Tools 3161 and 3162).
- D. Remove the Mounting Plate and the Stage 7 Rotor Disk Assembly from the Turnover Stand.
- (1) Pull the locking pin on the trunnion arm, turn the thumbscrew on the pin to retain the pin in the unlocked position. Depress the pedal controlling the lock on the opposite trunnion arm, then using the cranked handle, turn the assembly through 180 deg. so that the rotor disk and mounting plate are uppermost.
 - (2) Release the foot pedal and engage the locking pin so that the assembly is secure.
 - (3) Connect the overhead hoist to the lifting ring of the mounting plate. Unscrew the nuts securing the mounting plate to the trunnion arms, pivot the bolts outwards to release the mounting plate.
 - (4) Raise the assembly clear of the turnover stand, then transfer and position the assembly over the bench. Place a support (Tool 1095) beneath the assembly, then lower the hoist until the stage 7 disk abuts the bolster. Ensure that the disk is seating correctly on the bolster, then unscrew the four slave nuts retaining the mounting plate to the rotor shaft rear.
 - (5) Operate the hoist and raise the mounting plate clear of the stage 7 disk assembly. Transfer the mounting plate back to the turnover stand, then reassemble the plate to the two trunnion arms and secure with the bolts and nuts. Expand a protection band (Tool 1129) over the tips of the rotor blades.

OVERHAUL

- E. Disassemble the Rotor Shaft Rear, Stage 6-7 Spacer Ring and the Stage 7 Rotor Disk.
- (1) Remove the 24 clips retaining the bolts then withdraw the bolts from the stage 6-7 spacer ring and rotor shaft rear. Place the bolts and clips in containers.
 - (2) Assemble the lifting fixture (Tool 1017) to the rotor shaft rear.
 - (a) Slacken the thumbnut on the lifting fixture sufficiently to disengage the sliding arm, then assemble the lifting fixture to the rotor shaft rear.
 - (b) Engage the sliding arm into one of the slots in the locking cone then lock the arm with the thumbnut.
 - (3) Attach the overhead hoist to the lifting fixture then raise the rotor shaft rear clear of the stage 6-7 spacer ring and stage 7 rotor disk. Lower the shaft onto the worktop, disconnect the hoist then remove the lifting fixture. Place the rotor shaft rear in container (Tool 1379).
 - (4) Check bolt protrusion through nuts before slackening. Note bolts with less than 2.5 thread pitches showing beyond nut chamfer and discard them when removed (Ref.SB.72-8449-191).
 - (5) Remove the 24 locknuts securing the stage 7 rotor disk to the stage 6-7 spacer ring. Assemble a labyrinth protector (Tool 1170) to the stage 6-7 spacer ring, then place the spacer ring and stage 7 rotor disk with the previously disassembled components from the compressor assembly.
- F. Disassemble items from Rotor Shaft Rear (Ref.Fig.116).
- (1) Remove securing bolts and remove the sleeve housing.
 - (2) Remove seal from the shoulder of sleeve housing.
 - (3) Remove spherical mounting.

LP COMPRESSOR CASE AND VANES - DISASSEMBLY

1. General

- A. Prior to commencing disassembly, refer to 72-09-00 Disassembly for general information.
- B. Throughout the text special tools are quoted by their Ref.No. e.g. (Tool 1234). For a complete list of tooling required for the disassembly and for the Manufacturer's Part No., refer to Special Tools, Fixtures and Equipment Table 1001.
- C. The LP compressor case will be received from 72-31-00 assembly in a disassembled condition except for the stage 6 stator vanes, labyrinth rings/fixing rings, brackets, spherical bearings and bushes. The LP case will be assembled to the disassembly turnover stand, where the vanes and brackets on the blow-off flanges will be disassembled.

2. Disassemble LP Case Items

- A. Disassemble Front Mounting Bracket, Spherical Bearings and Bushes from the Front Flange.
 - (1) Unscrew and remove the two nuts securing the mounting bracket pins, then remove the bolts, pins and mounting bracket, place the items in a container.
 - (2) Unscrew and remove the two nuts securing the two spherical bushes at the outer locations on the flange, then remove the four spherical bushes with their spherical bearings. Discard the spherical bushes and spherical bearings.
- B. Prepare the Stand.
 - (1) Using the cranked handle of the turnover stand (Tool 1317), turn the stand so that the mounting face of the adapter plate is facing down.

OVERHAUL

- (2) Check that the brass extractor pads do not protrude beyond the abutment face of the plate and that all the clamping plates on the adapter plate have been slackened off so that the plates are sufficiently withdrawn to clear the LP case front flange when the case is assembled to the plate.
- C. Assemble the LP Case to the Adapter Plate.
- (1) Guide the support arms of a fork lift apparatus beneath the pallet supporting the LP case. Raise the fork lift so that the pallet just clears the floor.
 - (2) Move the pallet and case under the adapter plate, aligning the 'TOP' of the LP case with the 'TOP' of the adapter plate. Raise the fork lift until the guide pins in the adapter plate are about to enter the corresponding holes in the LP case front flange. Check that the adapter plate is level; then raise the fork lift so that all the guide pins enter the front flange at the same time.
 - (3) With the LP case correctly located and abutting the adapter plate, slide the clamping plates into position on the LP case front flange. Secure all the clamping plates to the case flange by tightening the clamping plate bolts. Lower the fork lift then withdraw the pallet.
- D. Remove the Stage 6 Stator Vanes and Vane Fixing Ring.
- (1) Using the cranked handle on the stand, turn the adapter plate until the LP case is in the horizontal position, adjust up or down as necessary to obtain a convenient working height.

IN12083

OLYMPUS 593

MK.610-14-28
OVERHAUL

- (2) Remove and discard the locking wire locking the bolted vanes and probe vanes on the outside of the case. Unscrew and remove all the bolts and sleeves from these locations. Unscrew and remove the plug and support plug assembly retaining bolts. Remove the plug and plug support assembly from the case. Place all the items in a container.

NOTE: Prior to carrying out the following operation, check bolt protrusion through nuts before slackening. Note bolts with less than 2.5 thread pitches showing beyond nut chamfer and discard them when removed (Ref.SB.72-8259-153).

- (3) Unscrew and remove the two nuts securing the vane retaining plate at the loading slot inner fixing ring location. Remove the retaining plate then place the items in a container. Discard the bolts.

- (4) Slide each vane round the LP case and inner fixing ring grooves, then disengage each vane through the loading slot location. Place the vanes in a container (Tool 1393).

- (5) Remove other three remaining plates in a similar manner as in (3); discard the six bolts.

E. Disassemble Retaining Rings , Nuts, Retaining Plates and Bolts from the Labyrinth Rings/Fixing Rings.

NOTE: Do not separate the labyrinth rings from the fixing rings.

- (1) Place the stage 1 labyrinth ring/fixing ring on the worktop with the labyrinth ring uppermost.
- (2) Remove the bolt retaining rings from the two bolts at the loading slot location, discard the retaining rings.
- (3) Unscrew and remove the six nuts securing the three retaining plates then place the nuts and plates in a container.
- (4) Carefully remove the eight bolts from the labyrinth ring/fixing ring; discard the bolts.
- (5) Adopting a similar procedure, disassemble the retaining rings, nuts, plates and bolts from the remaining labyrinth rings/fixing rings, place the items in a container except for the bolts which are to be discarded.

DISASSEMBLY

MK. 610-14-28
OVERHAUL

- (6) Carefully place the labyrinth rings/fixing rings in the appropriate part of the container (Tool 1440).
- F. Remove Brackets and Special Bolts from the Front and Rear Blow-off Flanges.
- (1) Using the cranked handle, on the stand, turn the adapter plate until the LP case rear flange is uppermost.
- NOTE: Do not remove the mounting bracket (4-70) or the identification plate (4-40) from the front blow-off flange without authority.
- (2) If the identification plate is to be removed, immobilize the shear neck type nuts, with a gripping device, then unscrew the bolts, discard the nuts.
 - (3) Disassemble nuts, bolts and brackets from the front and rear blow-off flanges. Place the items in a container.
- G. Disassemble Pulse Probe or Blanking Plate.
- (1) Remove the three bolts and the bracket from the bottom rear of the case, then carefully withdraw the pulse probe on engines to pre SB.71-8314-28 or the blanking plate on engines incorporating SB.71-8314-28.
- H. Remove the LP Case from the Stand.
- (1) Attach a multiple leg sling (Tool 1178) to the overhead hoist then position the hoist over the LP case. Adjust the hoist so that the lifting hook takes up a central position over the top of the case. Assemble the three attachment plates of the sling to the rear flange of the case at equidistant positions, then secure the attachment plates with their thumbscrews.
 - (2) Operate the hoist sufficiently to take up the slack in the whips, then release the clamping plates retaining the LP case front flange to the adapter plate of the turnover stand.
- CAUTION: DO NOT TRY TO RAISE THE CASE CLEAR OF THE ADAPTER PLATE AT THIS STAGE.

OLYMPUS 593

MK.610-14-28

sneema

- (3) Carefully take the weight of the LP case, then turn the extractor screws on the underside of the mounting plate in equal increments until the brass pads push the case clear of the guide pins and the spigot location. Raise the case clear of the stand then lower onto a pallet.
- (4) Disconnect the hoist then remove the multiple leg sling. Transfer the LP case inner fixing rings and loose items to the cleaning area. Ensure that an identification tally is attached to the groups of components.

J. Remove Liners from Fixing Rings.

- (1) On engines to SB.72-8690-296, SB.72-8730-298 and SB.72-9061-434 standard, release peening and remove the anti-fret liners from the fixing rings, stages 1 to 6.

LP COMPRESSOR EXIT GUIDE CASE AND VANES - DISASSEMBLY

1. General

- A. Prior to commencing the disassembly, refer to 72-09-00 Disassembly for general information.
- B. The top and bottom LP exit guide vane cases will be received on a pallet with the LP compressor group for disassembly.
- C. After the removal of the vanes, the top and bottom half cases must be kept together as a matched pair and suitably identified.

2. Disassemble the Exit Guide Cases and Vanes

A. Prepare for Disassembly.

- (1) Place the top and bottom exit guide cases on a suitable worktop.
- (2) Remove and discard the locking wire from the fixed vane securing bolts in the top and bottom half cases. Remove and discard the locking wire from the four probe plugs in the top and bottom half cases.
- (3) Unscrew and remove the bolts, sleeves, probe plugs and washers from both cases.

B. Remove the Vanes and Seals from the Exit Guide Cases.

- (1) Remove the 54 nuts and bolts retaining the seals to the vanes. Place the seals, nuts and bolts in a container.
- (2) Remove the vanes from the top and bottom half cases, place the vanes in a container. Place the two half cases on a pallet, then tie an identification tally onto each case. Transfer the vanes and cases to the cleaning area.

LP COMPRESSOR ROTOR - DISASSEMBLY

1. General

- A. Prior to commencing disassembly, refer to 72-09-00 Disassembly for general information.
- B. Throughout the text special tools are quoted by their Ref.No. e.g. (Tool 1234). For a complete list of tooling required for the disassembly and for the Manufacturers Part No., refer to Special Tools, Fixtures and Equipment Table 1001.
- C. The LP (bladed) rotor disks will be received, on pallets, from 72-31-00 disassembly. Ensure all items are suitably identified and placed in the appropriate containers as detailed in the following text.

2. Disassemble the Blades from Stage 1-7 LP Rotor Disks

- A. Remove the Blades from the Stage 1 Disk.
 - (1) Assemble the lifting fixture (Tool 401) to the Stage 1 disk (Ref.Fig.101).
 - (a) Attach a hoist to the lifting fixture and position the fixture above the disk.
 - (b) Ensure the hand knobs of the lifting fixture are located at the 'FREE' position then lower the hoist and engage the end plate of the fixture in the disk. Raise the hand knobs and move to the 'LOCK' position, engaging the lugs under the disk, depress the hand knobs to engage their locking pins.
 - (2) Raise the hoist and position the disk on suitable blocks or support (Tool 1326). Raise the hand knobs of the lifting fixture and move to the 'FREE' position, depress the knobs to engage the locking pins, then raise the hoist and remove the fixture.
 - (3) Remove the blade protection/retaining band then remove the blade retaining bands in turn and slide the blades down out of the disk, do not allow the blades to fall. Place all blades in the container (Tool 1395). Blades that are not to the standard of SB.72-8787-300 are to be returned to the manufacturer.

- (4) Check bolt protrusion through nuts before slackening. Note bolts with less than 2.5 thread pitches showing beyond nut chamfer and discard them when removed (Ref.SB.72-8449-191).
- (5) Unscrew and remove the 19 nuts from the uppermost face of the disk then remove the balancing weights and bolts. Using the lifting fixture (Tool 401) Ref.para.(1). Place the disk in the container (Tool 1409).

B. Remove the Blades from Stage 2 Disk.

- (1) Assemble the multiple leg sling (Tool 1285) to the stage 2 disk (Ref.Fig.102).
 - (a) Attach the sling to a hoist and position the hoist above the disk.
 - (b) Unscrew and remove the three nuts and washers from the waisted bolts of the sling. Equi-space the bolts around the disk then pass the bolts through the holes in the disk and reassemble the washers and nuts to the bolts to secure the sling.
- (2) Raise the hoist and position the disk on suitable blocks or support (Tool 1326), then unscrew and remove the nuts and washers from the sling bolts, raise the hoist and remove the sling.
- (3) Remove the protection/retaining band then remove the blade retaining bands in turn and slide the blades down out of the disk, do not allow the blades to fall. Place all blades in the container (Tool 1396).
- (4) Unscrew and remove any nuts, from the underside of the disk, securing balancing weights and bolts then remove both weights and bolts. Using the multiple leg sling (Tool 1285) Ref.para.(1) place the disk in the container (Tool 1407).

C. Remove the Blades from Stage 3 Disk.

- (1) Assemble the multiple leg sling (Tool 1217) to the stage 3 disk (Ref.Fig.103).
 - (a) Attach the sling to a hoist and position the sling above the disk.
 - (b) Assemble to the disk, from the rear (underside) face, four equi-spaced slave bolts (Tool 367). Engage each bolt in the larger knurled nuts of the sling blocks and fully tighten the nuts.

OVERHAUL

- (2) Raise the hoist and position the disk on suitable blocks or support (Tool 1326). Unscrew the knurled nuts raise the hoist and remove the sling, then remove the slave bolts from the disk.

NOTE: The sling may be left attached to the disk whilst the blades are being removed.

- (3) Using a light alloy chisel bend each blade locking key upward until vertical. Using a light alloy drift, on the blade root, steadily drift each blade out of the disk, ensure the blades do not drop. Remove the locking keys from the blade roots and place the blades in the container (Tool 1397).
- (4) Unscrew and remove any nuts, from the underside of the disk, securing balancing weights and bolts then remove both weights and bolts. Using the multiple leg sling (Tool 1217) Ref.para.(1) place the disk in the container (Tool 1408).

D. Remove the Blades from Stage 4 Disk.

- (1) Assemble the multiple leg sling (Tool 1217) and slave bolts (Tool 426) to the stage 4 disk and remove the blades as detailed in para.C.

NOTE: Ignore the reference to balancing weights, use the container (Tool 1398) for the stage 4 blades and container (Tool 1407) for the stage 4 disk.

E. Remove the Blades from Stage 5 Disk.

- (1) Assemble the multiple leg sling (Tool 1217) and slave bolts (Tool 426) to stage 5 disk and remove the blades as detailed in para.C.

NOTE: Ignore the reference to balancing weights, use the container (Tool 1399) for the stage 5 blades and container (Tool 1407) for the stage 5 disk.

LP COMPRESSOR DRIVE SHAFT - DISASSEMBLY

1. General

- A. Prior to commencing disassembly, refer to 72-09-00 Disassembly for general information.
- B. Throughout the text special tools are quoted by their Ref.No. e.g. (Tool 1234). For a complete list of tooling required for the disassembly and for the Manufacturers Part No., refer to Special Tools, Fixtures and Equipment Table 1001.
- C. The LP drive shaft will be received in a transporter or mobile stand with protectors assembled to each end of the shaft, and the signal shaft tube as a separate item. The disassembly entails the removal of the drive shaft rear and the removal of the stiffener disk assembly from the drive shaft front, and the removal of items from the shafts and the signal tube.

2. Disassemble the LP Drive Shaft

- A. Assemble the LP Drive Shaft to the Stand (Ref.Fig.101).
 - (1) Unscrew and remove the nuts, balancing weights and bolts and remove the sealing ring from the drive shaft front.
 - (2) Remove the protector (Tool 408) from the end of the drive shaft rear, then screw the lifting fixture (Tool 1055) onto the end of the shaft and connect a hoist to the fixture.
 - (3) Release and hinge open the bushes if the drive shaft is in the mobile stand, then supporting the front end of the shaft, raise the rear end of the shaft (by hoist) until the shaft is vertical and clear of the transporter or mobile stand.
 - (4) Release and remove the protector (Tool 999) from the (bottom) front end of the shaft, then position and lower the drive shaft into the stand (Tool 1110).

B. Remove the LP Drive Shaft Rear.

- (1) Unscrew and remove the nuts, balancing washers and bolts securing the front and rear shafts. With the lifting fixture and hoist still attached to the rear shaft, raise the hoist, then position and lower the shaft onto a suitable clean flat surface. Disconnect the hoist, then unscrew and remove the lifting fixture.
- (2) Remove the sleeve from the rear end of the rear shaft using the mechanical puller (Tool 1305) (Ref.Fig.102).
 - (a) Screw in on the small tommy bar until the cone is out of engagement with the three claws, allowing them to retract under the action of the springs.
 - (b) Unscrew the large tommy bar to move the claw assembly away from the handle.
 - (c) Slide the claw assembly into the rear shaft until the flange on the claw cover plate abuts the spacer.
 - (d) Hold the knurled ring and screw out on the small tommy bar causing the cone to extend the claws behind the sleeve.
 - (e) Screw in on the large tommy bar and engage the plate in the shaft, then continue screwing, holding the knurled ring steady, until the spacer is released.
 - (f) Withdraw the puller and spacer from the shaft. Screw in on the small tommy bar to retract the claws, then withdraw the spacer from the puller and place the spacer in a suitable container.
- (3) Release and open the clamp of fixture (Tool 1451), then lower the rear shaft into the fixture. Close and secure the clamp.

C. Remove the Stiffening Disk Assembly from the LP Drive Shaft Front.

- (1) Assemble the extractor (Tool 655) to the stiffener and shaft (Ref.Fig.103).
 - (a) Push in the central knurled ended rod until the three claws are fully retracted into the rod end. Unscrew on the three central spokes to withdraw the disk extractor plate. Unscrew the knurled sleeve to extend the extractor, then attach a hoist to the top mounting.
 - (b) Lower the extractor into the disk stiffener until the support ring spigots onto the shaft flange and the top mounting rests on the hydraulic ram.
 - (c) Pull out the central knurled ended rod to open the claws, then screw down the knurled sleeve until resistance is felt as the claws locate against the disk stiffener. Screw down on the three spokes and guide the three lugs on the outer disk through the three slots in the extractor plate. Rotate the extractor plate to trap it behind the three lugs, then unscrew on the three spokes until the plate is in firm contact with the lugs.
- (2) Operate the extractor to release the disk stiffener from the shaft.
 - (a) Attach the hose of a hand hydraulic pump to the hydraulic connector (Enerpak female half coupling AR400).
 - (b) Operate the hand pump until the stiffener disk is released from the five lands in the shaft.
- (3) Remove the extractor.
 - (a) Release the extractor plate from the outer disk by screwing down on the three spokes to release the plate then rotating the plate until the cut-outs align with the disk lugs.

FN27446

OLYMPUS 593
MK.610-14-28
OVERHAUL

- (b) Release the hydraulic pressure allowing the extractor rod to be lowered into the disk assembly, then disconnect the hydraulic hose.
- (c) Unscrew the knurled ring, push down on the knurled ended rod to release the claws, then raise the hoist to withdraw the extractor from the shaft and disk assemblies, and lower the extractor onto a suitable surface.
- (4) Withdraw the disk assembly from the shaft and place it on a clean protected surface.
- (5) Unscrew and remove the three nuts and bolts securing the bearing retaining plate at each end of the stiffening disk assembly and remove the plates.
- (6) If the stiffening disk assembly is stained heavily enough to require a heavy cleaning process (Process F, Ref. 72-31-04 Cleaning) prior to crack detection the carbon bearings must be removed as follows:
- (a) Heat the assembly to 400 deg. C, then drive the bearings out using a long drift. Discard bearings after removal.
- (b) If this procedure fails to remove the bearings they may be machined out.
- D. Remove the LP Drive Shaft Front from the Stand.
- (1) Locate the lifting fixture (Tool 1109) on the rear flange of the drive shaft front and secure the fixture to the shaft with slave bolts (Tool 328) and nuts.

- (2) Attach a hoist to the lifting fixture, raise the shaft out of the stand until clear of the stand, then position and lower the shaft over the fixture (Tool 1450). Release and open the clamps of the fixture. Lower the shaft into the fixture, release and remove the lifting fixture, then correctly locate the shaft in the fixture. Close and secure the clamp.
 - (3) Place all loose items in a suitable container.
- E. Disassemble the LP Signal Shaft Tube (Ref.Fig.104).
- (1) Locate the vice holder (Tool 1301) in a hand vice and secure the holder, then remove the signal shaft from its fixture (Tool 1452) and insert the serrated sleeve on the end of the shaft into the holder. Release the locking washer securing the screwed plug, then using spanner (Tool 1614) unscrew and remove the plug.
 - (2) Withdraw the sleeve from the holder, then withdraw the serrated and locking sleeve from the signal shaft.
 - (3) Withdraw the seal ring pack from its location at the rear end of the shaft and slide the pack to the front end of the shaft and remove.
 - (4) Place the signal shaft tube in its fixture (Tool 1452), and the loose items in container (Tool 1378) with the generating mechanism items from breakdown 72-31-05.

COMPRESSOR INTERMEDIATE CASE - DISASSEMBLY

1. General

- A. Prior to commencing the disassembly, refer to 72-09-00 Disassembly for general information.
- B. Throughout the text special tools are quoted by their Ref.No. e.g. (Tool 1234). For a complete list of tooling required for the disassembly and for the Manufacturers Part No., refer to Special Tools, Fixtures and Equipment Table 1001.
- C. The LP compressor thrust bearing and housing assembly will have been removed from the LP compressor rear during engine bulk disassembly (Ref.72-00-00 Disassembly) and will be received for disassembly in a protective container as a separate item. During Overhaul procedure these items must remain with the intermediate case assembly.
- D. The inner sub-assembly (5-330) and the outer sub-assembly (5-420) are to remain together as one unit, therefore it is not recommended that the two items be separated during normal overhaul. In addition, the inner sub-assembly (5-330) and the three segments bolted to it are manufactured as a matched set and must not be disassembled.
- E. It is essential (at the seal locations) that the sealing grooves are hand lapped and the sealing faces are skim ground to remove any areas of damage caused by Metaflex seals. A satisfactory surface finish, to install 'C' seals, must be achieved (Refer to Chapter 72-32-00 Assembly).

2. Assemble the Intermediate Case to the Disassembly Stand

- A. Prepare the Intermediate Case.
 - (1) Remove the protection cover from the front of the intermediate case.
 - (2) Carefully remove the HP probe operating/labyrinth ring from the HP bevel gear and place the ring in a container.

DISASSEMBLY

72-32-00

Page 101

OVERHAUL

- (3) Assemble the multiple leg sling (Tool 1089) to three equally spaced positions on the front flange, then connect a hoist to the sling ring.
- (4) Raise the intermediate case off its container, then release and remove the packing pieces assembled to the rear flange. Reassemble the slave nuts to the packing pieces and stow.
- (5) Raise the case to a convenient working height then assemble the bearing retainer (Tool 434) to the bearing assembly and HP bevel gear. Secure the retainer with the thumbnut (Ref.Fig.102).

B. Secure Case to Stand (Ref.Fig.101).

CAUTION: ENSURE BRAKE SCREW IS APPLIED DURING DISASSEMBLY PROCEDURE.

- (1) Using the cranked handle, adjust the disassembly stand (Tool 1263) until the mounting plate is front face uppermost.
- (2) Lower the intermediate case onto the disassembly stand aligning the TOP of the intermediate (No.1 vane) with the TOP marked on the stand. Secure the intermediate case to the stand using slave bolts and nuts, then disconnect and remove the sling.
- (3) Apply release agent (Ref.72-09-00 Disassembly) to the 30 bolts visible between the inner wall of the inner case and the HP bearing housing. Allow a reasonable period of time for penetration before turning the intermediate case rear flange uppermost.

3. Disassemble the HP Bearing Housing Assembly

A. Remove Air Baffles (Ref.Fig.102).

- (1) Using the cranked handle, turn the disassembly stand until the rear flange of the intermediate case is uppermost.
- (2) Apply release agent to the dowels and bolt positions on the air baffle unit, then also apply release agent to the locking lugs on the HP rear baffle and inner labyrinth housing.

DISASSEMBLY

72-32-00

Page 103

Dec 1/96

OLYMPUS 593

MK.610-14-28

OVERHAUL

- (3) Remove the 24 bolts securing the air baffle assembly at the outer location, then remove the 12 securing bolts from its inner location. Remove the outer air baffle assembly and place the items in a container.
- (4) Using a suitable driver and hammer, carefully free the rear outer baffle from its corresponding locking lugs on the inner labyrinth housing. Remove the rear outer and rear inner air baffles and place them in a container.

CAUTION: EXERCISE CARE WHEN REMOVING THE FOLLOWING BOLTS.

- (5) Release the 30 bolts at the inner location retaining the inner labyrinth housing and bearing retainer to the bearing housing assembly. Apply a further application of release agent to the bolts then remove the bolts and place in a container.

B. Remove the Inner Labyrinth Housing.

- (1) Remove the bolted half segment from the inner disk of the mechanical puller (Tool 823) to facilitate assembly of the puller to the labyrinth housing.
- (2) Assemble the puller to the bearing housing so that the segment locates under the shoulder of the inner labyrinth housing.
- (3) Reassemble the half segment, then readjust the puller to engage both segments under the shoulder of the inner labyrinth.
- (4) With the outer ring of the puller located on the bearing housing, withdraw the inner labyrinth from its location. Remove the puller from the labyrinth housing, then place the housing in a container.

C. Remove the Bearing Retainer.

- (1) Screw a puller (Tool 1668) into each extraction position nearest the dowels locating the retainer.
- (2) Turn each puller in equal increments until the retainer is free of its location. Remove the pullers and place the retainer in a container.
- (3) Remove the seal from the bearing housing and discard as follows:
 - (a) Pre SB.0L.593-72-9019-404 standard, remove the Metaflex seal.
 - (b) SB.0L.593-72-9019-404 standard, remove the Kalrez O-ring.
 - (c) SB.0L.593-72-9053-426 standard, remove the metal 'C' seal.

D. Remove the HP Bearing Housing Assembly.

CAUTION: EXERCISE CARE WHEN REMOVING THE HP BEARING ASSEMBLY FROM THE SIX DOWELS.

- (1) Remove the 18 bolts from the outer location of the bearing housing.
- (2) Screw a puller (Tool 1668) into each of the extractor positions nearest the dowels in the housing.
- (3) Turn each puller in small equal increments until the bearing housing is released from the dowels.
- (4) Carefully lift the bearing housing assembly from the intermediate case, taking care not to knock and damage the HP bevel gear on the inner case. Place the assembly on a protected worktop, then remove the six pullers.

E. Remove the HP Bearing from the Housing.

- (1) Remove the knurled thumbnut securing the bearing retaining plates, then remove the upper plate.

- (2) Lift the bearing housing assembly clear of the lower retainer and bevel gear, then place the bevel gear adjusting washer and oil thrower from the top of the bearing into a container.

NOTE: Assistance will be required to immobilize the bearing housing when lifting out the bearing.

- (3) Carefully lift the bearing out of the housing, then place the bearing in a protective container.
- (4) Reverse the bearing housing, then, using a suitable driver and hammer, carefully tap the oil baffle free of its pins. Place the oil baffle and bearing housing in a container.

F. Disassemble the Air Baffle from the Inner Case (Fig.103).

- (1) Assemble the mechanical puller (Tool 932) to the air baffle and secure with slave bolts.
- (2) Adjust the puller until the thrust ring is resting on the inner case flange.
- (3) With the puller correctly located withdraw the air baffle, disassemble the baffle from the puller, then place the baffle in a container.

4. Disassemble the Right and Left-hand Gearbox Mounting Assemblies

A. Disassemble the Right-hand Gearbox Mounting Assembly (Ref.Fig.104).

- (1) Turn the stand until the intermediate case front flange is uppermost.
- (2) Ensure that the threads of the mechanical puller (Tool 959) are clean and free from damage, then screw the puller into the hollow pin until the flange of the screw abuts the intermediate case flange. Locate the pot of the puller over the screw, then assemble the locknut and washer to the screw (Ref.S.B.72-8678-249).

CAUTION: EXERCISE CARE WHEN WITHDRAWING HOLLOW PIN FROM FLANGE.

- (3) Hold the screw stationary, then turn the locknut in small increments and carefully withdraw the hollow pin, avoiding excessive load or erratic movement being applied to the locknut.
- (4) Unscrew and remove the six bolts retaining the diaphragm.
- (5) Withdraw the bracket assembly from the drive housing, then disassemble the adjusting plate and seal. Discard seal.

B. Disassemble the Left-hand Gearbox Mounting Assembly (Ref.Fig.105).

- (1) Ensure that the threads of the mechanical puller (Tool 959) are clean and free from damage, then screw the puller into one of the hollow pins in the flange of the intermediate case. Ensure the flange of the screw abuts the intermediate case flange. Locate the pot of the puller over the screw, then assemble the locknut and washer to the screw.

CAUTION: EXERCISE CARE WHEN WITHDRAWING THE HOLLOW PINS FROM THE FLANGE.

- (2) Hold the screw stationary, then turn the locknut in small increments and carefully withdraw the hollow pin, avoiding excessive load or erratic movement being applied to the locknut.
- (3) Using the puller (Tool 959), repeat the operation to remove the second hollow pin. Place the pins in a container.
- (4) Unscrew and remove the four bolts securing the air seal retainer.

OVERHAUL

- (5) Disassemble and discard the 15 retaining rings retaining the 15 gearbox bolts.
- (6) Withdraw the adapter plate, adjusting shim and mounting bracket assembly from the drive housing, then remove the eight bolts retaining the mounting assembly to the adapter.
- (7) Disassemble the 15 bolts, air seal retainer, adjusting ring, air seal ring and seal from the adapter.
- (8) Discard the seal and place all the other items in a container.

5. Disassemble Switches, Sump, Adapter and Splined Shaft

A. Remove the Oil Pressure Transmitter (Ref.Fig.106).

CAUTION: AVOID DAMAGE TO JOINT FACES WHEN REMOVING COMPONENTS AND GASKETS.

- (1) Unscrew and remove the bolts securing the oil pressure transmitter switch, then withdraw the switch and discard the seal. Place the switch in a protective container.
- (2) Ensure that the mating face of the protector (Tool 572) is undamaged, then assemble the protector to the switch face on the sump case, and secure it with the waisted screws.

B. Remove the Oil Pressure Switch (Ref.Fig.106).

- (1) Unscrew and remove the bolts securing the oil pressure switch and bracket to the sump case, then withdraw the switch and bracket and discard the seal. Place the switch in a protective container.

- (2) Ensure that the mating face of the protector (Tool 571) is undamaged, then assemble it to the switch face on the sump case and secure with the waisted screws.
- C. Remove the LP Pulse Probe (Ref.Fig.106).
- (1) Remove the bolts securing the LP pulse probe to the sump case, withdraw the pulse probe, discard the seal then place the probe in a protective container.
 - (2) Ensure that the mating face of the protector (Tool 570) is undamaged, then assemble it to the pulse probe face on the sump case and secure it with the waisted screws.
 - (3) Unscrew and remove the bolts, cover, and gasket from the LP hand turning location on the sump, then place the cover in a container.
- D. Disassemble the Sump Case from Adapter (Ref.Fig.106).
- (1) Unscrew and remove the 13 bolts and one self-locking nut retaining the sump case to the adapter. Support the sump case during this operation.
 - (2) If necessary, lightly tap the sump case with a suitable mallet to break the seal between the sump case and gasket.
 - (3) Carefully withdraw the sump case and splined shaft, then place the sump case assembly on the worktop. Discard the gasket.
- E. Disassemble the Gland Nuts and Adapter Assembly (Ref.Fig.107).
- (1) Remove and discard the locking wire from the gland nuts locking plate securing bolts and the adapter securing bolts.

OVERHAUL

- (2) Unscrew and remove the locking plate securing bolts, then remove the locking plate and plain washers.
- (3) Using the special spanner wrench (Tool 1527) unscrew and remove both gland nuts.
- (4) Remove the four bolts securing the adapter to the intermediate case.
- (5) Apply a small quantity of release agent to the hollow pin positions locating the adapter to the intermediate case.

CAUTION: EXERCISE CARE WHEN REMOVING THE ADAPTER.

- (6) Using a suitable mallet, very carefully tap the adapter to ease it from the hollow pin locations ensuring that the adapter is kept square until released.
- (7) Place the adapter face down on the worktop, then push out the spacers, seals and air seal rings. Discard the seals, then place the adapter and items in a container.

F. Disassemble the Splined Shaft and Bearing Assembly from the Sump Case (Ref.Fig.108).

- (1) Remove the retaining ring from within the sump case (located in front of the bearing), and place the ring in a container.
- (2) Insert the mechanical driver (Tool 341) through the LP hand turning aperture in the sump case, then secure the driver with the bolts.
- (3) Turn the handle of the driver and carefully press the bearing assembly from the sump case. Remove the driver from the sump case, then place the case in a container.

- (4) Disassemble the small retaining ring from within the splined shaft, then withdraw the shearing quillshaft from the end of the splined shaft. If the quillshaft is to SB.72-3 standard, use the puller (Tool 177) to withdraw the quillshaft. Place the retaining ring and shearing quillshaft in a container.

G. Disassemble the Ball Bearing from the Splined Shaft
(Ref.Fig.108).

- (1) Assemble the splined shaft to the vice holder (Tool 336), then secure the holder to a bench vice.
- (2) Using the driver (Tool 339) and a general application wrench, turn the shaft to unscrew the bearing retaining nut. Remove the shaft and nut, then place both items in a container. Release and remove the holder from the vice.
- (3) Secure the support of the mechanical puller (Tool 342) to a bench vice, insert the splined shaft through the support, then adjust the location screws to locate the bearing.
- (4) Turn the driver handle and push the splined shaft through the ball bearing assembly. Release the ball bearing from the support, then place the shaft and bearing in a container. Release and remove the puller from the vice.

6. Disassemble Location Plates and Fire Covers from Outer Case

A. Remove the Fire Cover from No.1 Vane.

- (1) Remove the locking wire, then unscrew and remove the four bolts securing the fire cover then remove the cover. Place the bolts and fire cover into a container.

TN6002

B. Disassemble the Location Plate/Fire Cover from No.2 Vane.

- (1) Apply a small quantity of release agent to the splines and hollow pin locations of the location plate/fire cover.
- (2) Remove the locking wire and the four bolts securing the plate/cover to the case.
- (3) Ease the plate/cover from its location, if necessary, lightly tap the plate with a suitable mallet. Place the bolts and plate/cover in a container.

C. Disassemble the Location Plate/Fire Cover and Vent Tube from No.6 Vane.

- (1) Apply a small quantity of release agent to the splines and hollow pin locations of the location plate/fire cover.
- (2) Remove the locking wire and the four securing bolts from the plate/cover.
- (3) Ease the plate/cover from its location, if necessary, lightly tap the plate with a suitable mallet. Place the bolts and plate/cover in a container.
- (4) Insert a spanner between the front flanges of the intermediate case (the inner end of No.6 vane), then unscrew and remove the two bolts securing the vent tube to the wall of the case.
- (5) Apply a small quantity of release agent (if necessary) to the locating diameter of the vent tube in the inner case wall.
- (6) Ease the vent tube outboard from its location, then turn the tube 90 deg and withdraw it through the vane, place the bolts and tube into a container.

7. Disassemble the Lubrication System (Ref.Fig.109)

A. Disassemble the Oil Distributor from No.6 Vane Position.

- (1) Remove the bolt and tube retainer securing the cross feed tube to the main distributor, then push the cross feed tube into the distributor allowing its disengagement from the smaller distributor.
- (2) Remove the three bolts retaining the smaller distributor at No.6 vane position, then remove the distributor. Unscrew and remove the bolt and nut retaining the oil jet. Place the items in a container.

B. Disassemble Main Oil Distributor.

- (1) Withdraw the cross-feed tube from the distributor.
- (2) Disassemble the bolt and retainer from the LP bearing feed location, withdraw the tube and place in a container.
- (3) Remove the bolt and plate securing the HP bearing feed tube, then push the tube into the inner case.
- (4) Remove the LP probe retainer bolts, retainer, probe and the two adjusting washers, place the items into a protective container.
- (5) Remove the three oil distributor retaining bolts, then remove the distributor.
- (6) Disassemble the HP probe retainer, probe and the two adjusting washers from the distributor, then remove the oil jet.
- (7) Withdraw the oil sleeve, nozzle, and HP bearing oil feed tube from the inner case. Place all the items into a container.

C. Disassemble the Oil Feed Housing and Bearing Failure Warning Tube (Ref.Fig.110).

- (1) Turn the intermediate case rear flange uppermost.
- (2) Unscrew and remove the nine bolts retaining the oil feed housing (No.2 vane) to the inner case.
- (3) Partially withdraw the housing to permit access to the bearing failure warning tube.
- (4) Completely remove the locking wire from the bearing failure warning tube retaining nut.
- (5) Reassemble the oil feed housing to the inner case, then temporarily secure the housing with four equally spaced bolts.
- (6) Insert the crowfoot attachment socket wrench (Tool 1494) between the intermediate case rear flanges to engage correctly with the bearing failure warning tube retaining nut.

CAUTION: EXERCISE CARE WHEN DISASSEMBLING THE
RETAINING NUT.

NOTE: The retaining nut has been torque-tightened
to 240 lbf in. (27,1 N.m).

- (7) Carefully slacken off the retaining nut, then remove the four bolts temporarily retaining the oil feed housing to the inner case.
- (8) Withdraw the oil feed housing together with the bearing failure warning tube, then disassemble the warning tube from the housing.

- (9) Disassemble the pack sealing rings and Metaflex seal from their locations and discard. Place the oil housing, warning tube and bolts into a container.

NOTE: Do not remove the six bolts (5-400), nuts (5-390) and housing (5-410), these items are part of the outer sub-assembly (5-420).

8. Disassemble the LP Driven Bevel Gear and the Left and Right-Hand Accessory Drives

A. Disassemble the LP Driven Bevel Gear Assembly (Ref.Fig.111).

- (1) Using the cranked ring wrench (Tool 1581). Remove the five bolts securing the bearing housing assembly to the inner case (No.4 vane).
- (2) Secure the vice holder (Tool 356) in a bench vice, then assemble the bearing housing assembly to the holder.
- (3) Using the spanner wrench (Tool 1516) remove the bearing retaining nut from the shaft. Remove the assembly from the holder and the holder from the vice.
- (4) Place the support (Tool 355) on a firm worktop, then lower the assembly onto the support and locate the pins of the support through the provisioned access holes in the gear until the pins abut the adjusting washer behind the gear.
- (5) Assemble the driver (Tool 1515) to the gear shaft, then using a hammer, drive the gear shaft downwards to release the adjusting washer, roller bearing inner and inner spacer sleeve from the shaft. Remove the assembly and the gear from the support.

- (6) Remove the retaining ring from the bearing housing.
- (7) Secure the vice block of the draw screw puller (Tool 353) to the bench vice, then assemble the bearing housing assembly to the puller.
- (8) Assemble the mechanical puller (Tool 352) to the bearing housing assembly and to the threads of the draw screw puller (Tool 353).
- (9) With the claws of the mechanical puller correctly located on the ball bearing assembly, withdraw the ball bearing, outer sleeve and roller bearing outer track from the bearing housing. Remove the puller from the draw screw, then remove the items from the puller, the housing from the draw screw and the draw screw from the vice. Place all of the items into a container.

B. Disassemble the Left-hand Accessory Drive (Ref.Fig.112).

- (1) Remove the four bolts securing the bearing housing and gear assembly to the drive housing (No.5 vane), then withdraw the gear assembly from the inner case.

NOTE: Tooling application shown in Figure 112 is the same for pre and S.B.72-8784-307 standard of engine although only the pre-S.B. standard is illustrated.

- (2) Assemble the gear assembly to the support (Tool 256) and secure the gear with the retaining plates. Using the socket wrench (Tool 327) remove the bearing retaining nut, then remove the assembly from support.
- (3) Position the gear assembly on the worktop, then locate the smaller inside diameter of the split collar (Tool 623) under the shoulder of the ball bearing.
- (4) Lift the split collar and gear assembly, then locate the complete assembly onto the support (Tool 622).

- (5) Assemble the driver (Tool 630) to the gear shaft, then drive the gear shaft through the roller bearing inner, sleeve, ball bearing assembly and adjusting washer. Remove the driver, split collar and loose items. On engines to S.B.72-8784-307 standard, remove the damping plate from the gear shaft.
 - (6) Assemble the mechanical puller (Tool 701) to the bearing housing so that the extraction claw locates correctly behind the ball bearing.
 - (7) Secure the vice pad in the bench vice, then withdraw the ball bearing from the housing. Separate the mechanical puller and remove the loose items. On engines to S.B.72-8784-307 standard, remove the oil catcher ring from the bearing housing. Place all of the disassembled items into a container.
- C. Disassemble the Roller Bearing Outer Track from the Drive Housing (Ref.Fig.112).
- (1) Remove the eight bolts securing the left-hand drive housing to the inner case (No.5 vane).
 - (2) Using two pullers (Tool 1668) withdraw the housing from No.5 vane, remove the pullers.
 - (3) Remove from the drive housing the retaining ring from the recess in front of the outer track.
 - (4) Insert the extractor head of the mechanical puller (Tool 544) into the housing locating the extractor claws into the three provisioned recesses in the housing. Adjust the puller (Tool 255) so that it abuts the flange of the housing, then withdraw the roller bearing outer track. Release and remove the outer track from the puller. Place the retaining ring, outer track, housing and retaining bolts into a container.
- D. Disassemble the Right-hand Accessory Drive (Ref.Fig.113).
- (1) Remove the four bolts securing the bearing housing and gear assembly to the drive housing (No.3 vane), then withdraw the gear assembly from the inner case.

OVERHAUL

- (2) Assemble the gear assembly to the support (Tool 256) and secure the gear with the retaining plates. Secure the support in a bench vice.
- (3) Using the spanner wrench (Tool 1497) remove the bearing retaining nut.
- (4) Assemble the mechanical puller (Tool 258) to the gear assembly and adjust the clamp arms of the puller so that the extraction claws locate correctly behind the ball bearing assembly. Operate the puller and withdraw the ball bearing and the roller bearing inner from the shaft. Release and remove the bearings from the puller.
- (5) Disassemble the inner and outer spacers, adjusting washers and roller bearing outer from the gear.
- (6) Remove roller bearing inner track from gear.
 - (a) On engines to pre-S.B.72-8697-286 standard, withdraw the bearing inner track using the mechanical puller (Tool 257).
 - (b) On engines to S.B.72-8697-286 standard, withdraw the bearing inner track using the mechanical puller (Tool 3133), then remove the damping plate from the gear.
- (7) Place all disassembled items in a container.
- (8) Remove the eight bolts securing the housing to the inner case, then using two pullers (Tool 1668), withdraw the drive housing from No.3 vane.
- (9) Insert the mechanical puller (Tool 286) into the housing locating the claws of the puller behind the roller bearing outer track. Screw the mechanical puller (Tool 255) onto the puller already assembled until it abuts the housing, then continue turning the handle until the bearing is released. Release and remove the bearing from the mechanical pullers. Place the housing, bolts and roller bearing into a container.

9. Disassemble the Oil Sump Assembly and Drain Tube Retaining Bolts

A. Remove the Oil Sump from the Inner Case.

- (1) Remove the 11 bolts securing the oil sump assembly to the inner case (No.4 vane).
- (2) Screw four pullers (Tool 1668) into the extractor positions in the sump flange, turn each puller in equal increments until the sump becomes free, then remove the sump from the case. Remove the pullers from the sump.
- (3) Unscrew and remove the two bolts within the sump housing, then disassemble the support housing from the two pins. Discard the seal as follows, then place the items into a container:
 - (a) Pre SB.0L.593-72-9019-404 standard, discard the Metaflex seal.
 - (b) SB.0L.593-72-9019-404 standard, discard the Kalrez O-ring.
 - (c) SB.0L.593-72-9053-426 standard, discard the metal 'C' seal.

B. Disassemble the Drain Tube Retaining Bolts.

- (1) Turn the intermediate case so that No.1 vane is uppermost.
- (2) Insert the holding spanner (Tool 1582) through the sump aperture (No.4 vane inner case), then using standard wrench equipment, unscrew and remove the nine bolts and self-locking nuts from the drain tube and retainer. Remove the one off D-headed bolt and self-locking nut from the TOP position. Place the oil retainer nuts and bolts in a container.

NOTE: The drain tube is removed after the inner case has been lifted from the outer case.

10. Disassemble the Intermediate Inner Case Unit from the Outer Case

A. Release the Blanking Plate from Inner Case.

- (1) Turn the intermediate until the rear flange is uppermost.
- (2) Insert the internal threaded end of the slave bar (Tool 1805) through the access aperture of the outer case at the No.1 vane location, then screw the bar onto the threads of the centre bolt of the blanking plate bolted to the inner case. Secure the slave bar at the outer location with the thumbnut.
- (3) Unscrew and remove the four bolts and two tubes retaining the blanking plate to the inner case, place the items in a container.
- (4) Readjust the slave bar so that the blanking plate is now held against the inner wall of the outer case. Secure the plate in this position with the thumbnut at the outer case location.

NOTE: The blanking plate will be finally disassembled after the inner case has been removed.

B. Remove the Inner Case.

- (1) Gaining access through the rear of the case, remove the 18 bolts and nuts retaining the front inner case flange to the outer case. Place the nuts and bolts into a container.
- (2) Assemble a puller (Tool 1668) to each of the threaded extractor positions nearest the dowels in the rear flange of the inner case.
- (3) Turn each puller in equal increments until the inner case is free of the dowels.
- (4) Carefully lift the inner case from the outer case and place on the worktop. Assemble slave bolts and nuts to the outer sub-assembly (5-420) at No.4 vane location to retain the housing (5-380). Remove the pullers from the inner case.
- (5) Assemble six slave bolts and washers (equally spaced) to the front flange of the case unit (5-420/330).

- C. Remove the Housings from No.3 and 5 Vanes of the Inner Case.

NOTE: Prior to carrying out the following operation, check bolt protrusion through nuts before slackening. Note bolts with less than 2.5 thread pitches showing beyond nut chamfer and discard them when removed (Ref.SB.72-8334-205).

- (1) Unscrew and remove the bolts and nuts securing the accessory inner end drive housings from No.3 and 5 vanes.
- (2) Remove the housing and adjusting washers from each vane, then discard the seals as follows:
 - (a) Pre SB.0L.593-72-9019-404 standard, discard the Metaflex seal.
 - (b) SB.0L.593-72-9019-404 standard, discard the Kalrez O-ring.
 - (c) SB.0L.593-72-9053-426 standard, discard the metal 'C' seal.
- (3) Place the inner case, housings and adjusting washers into containers.

- D. Remove the Drain Tube and Blanking Plate from Outer Case.

- (1) Unscrew the thumbnut retaining the slave bar in position at No.1 vane. Disassemble the slave bar and plate, place the blanking plate into a container, then screw the thumbnut back onto the slave bar.
- (2) Remove the drain tube and oil retainer from the case.
- (3) Turn the intermediate case until the front flange is uppermost.
- (4) Assemble the multiple leg sling (Tool 1089) to three equi-spaced positions around the flange, then connect a hoist to the sling ring.
- (5) Unscrew and remove the slave nuts and bolts securing the intermediate outer case to the stand. Raise the case clear of the stand, then lower onto a suitable pallet, remove the sling. Reassemble the slave nuts and bolts to the stand.

11. Disassemble Segments from the Sub-assembly Inner Case

NOTE: The sub-assembly inner case (5-330), the sub-assembly outer case (5-420) and the bolted segments should not be disturbed unless their disassembly is considered essential. If disassembly of the cases is essential, then part of SB.72-8260-187 (three alignment holes bored in the front flanges) must be embodied before attempting disassembly.
